INTRODUCTION

Derwent World Patents Index provides access to information from more than 44 million patents, giving details of over 20 million inventions. Each week data are added from more than 20,000 documents from 47 patent-issuing authorities, including the European Patent Office and the World Intellectual Property Organization.

Each record describes a patent family, starting with the new invention (Basic Patent) and adding information about the same invention issued in other countries (Equivalent Patents). The records contain bibliographic data, titles, abstracts, general indexing and, where appropriate, in-depth chemical and polymer indexing, assigned by Thomson Reuters (Scientific). Additionally, electrical and engineering drawings are present in records dating back to 1988, and chemical structure drawings are present in records dating back to 1992.

Each week Thomson Reuters (Scientific) checks the specifications issued to determine whether the inventions described in them are new to Thomson Reuters (Scientific). If the document relates to an entirely new invention not previously seen by Thomson Reuters (Scientific), the document is designated as being 'Basic', and a new record is created in Derwent World Patents Index. If the document covers the same invention as a

Basic that has already been published in another country and has been entered into Derwent World Patents Index, the document is designated as being 'Equivalent'. The corresponding Basic record is updated with additional information from the Equivalent document. Together, the Basic and the Equivalent patents form a 'Patent Family'.

The Derwent World Patents Index on STN comprises invention documents and the individual publication records pertaining to it. The invention comprises the 'Patent Family' information such as bibliographic data, value-add title and abstracts, and general and Thomson Reuters (Scientific) assigned in-depth indexing. The individual patent publication records allow users to specifically search and display bibliographic data and general indexing information within the realm of the individual documents. Additional data elements such as original titles and abstracts, claims, addresses and agent information are also available for individual patent publications extending the reach of the query and opening the possibility for performing combined searches for value-added and first level data.

The seamlessly integrated Chemical Resource allows for chemical structure searching. It contains more than 1.7 million chemical structures.

COVERAGE

Subject Coverage

The subject coverage of Derwent World Patents Index has increased with time. The graph on the next page shows how this coverage has expanded over the years and the increase in the number of inventions (records) added annually.

In 1963, Thomson Reuters (Scientific) launched its FARMDOC service covering pharmaceutical and veterinary patents. This now corresponds to Section B as part of the Chemical Patents Index (CPI).

Coverage increased in 1965 to include patents relevant to agriculture and veterinary medicine with the launch of the AGDOC service (now Section C), and further still in 1966 to include plastics and polymers (the PLASDOC service, now Section A).

In 1970, the Chemical Patents Index was introduced, and the service was expanded to include all chemical and chemically-related patents (Sections A-M).

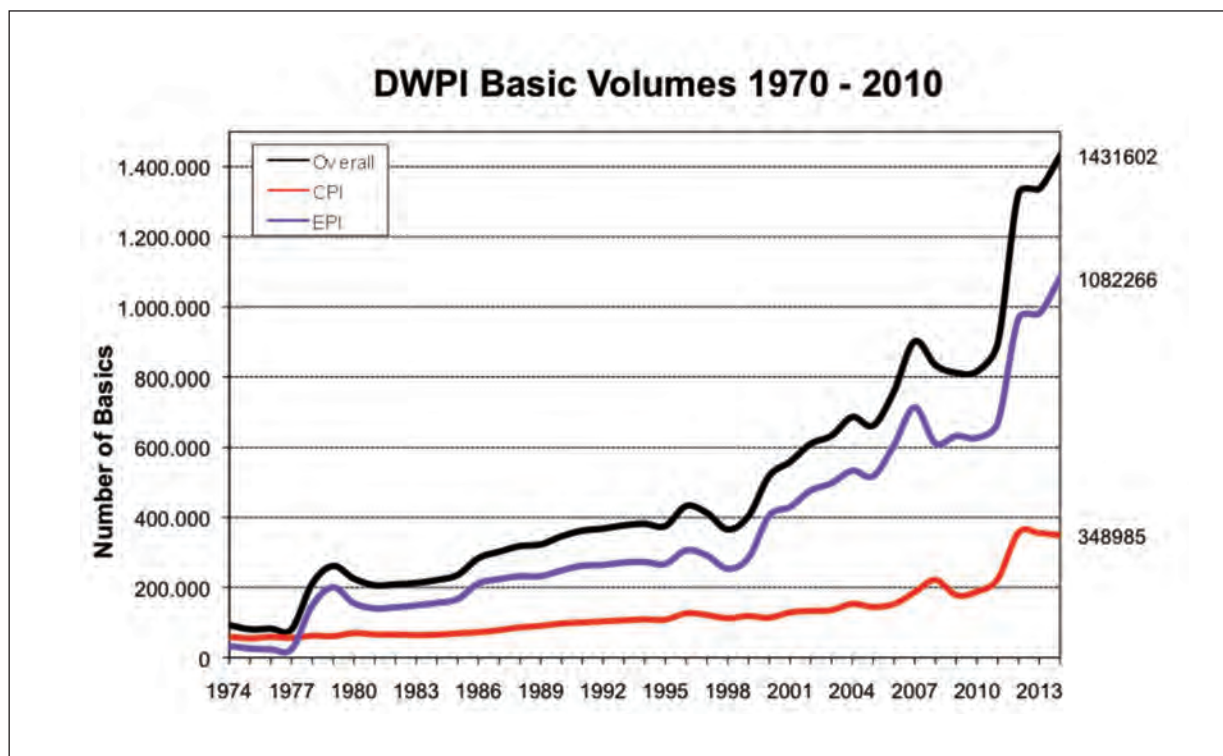

Subject Coverage (1963-1974)

1963	FARMDOC - Section B
1965	AGDOC - Section C
1966	PLASDOC - Section A
1970	Chemical Patents Index CPI
1974	Derwent World Patents Index (DWPI)

Since 1974, Derwent World Patents Index has included patent specifications irrespective of subject content, and these are divided into three major subject areas:

Subject Coverage (1974 onwards)

CPI	Chemical Patents Index	Sections A-M
EngPI	(GMPI) Engineering Patents Index	Sections P and Q
EPI	Electrical Patents Index	Sections S-X

Sources covered

45 patent-issuing authorities are now included in Derwent World Patents Index, many of these being added to the service since it commenced in 1963. The date when coverage began is shown in the following table, with both the year and database update (in parentheses) for those authorities added since 1963.

Asian Coverage

Thomson Reuters has extended the coverage of Asian patent publications significantly over time.

Japan

Japanese documents have been covered since 1963. Since the beginning of 1996, Thomson Reuters (Scientific) has covered all unexamined Japanese patent applications issued, irrespective of subject content. Previously coverage was selected as detailed below.

Until 1981, Thomson Reuters (Scientific) only covered chemical Japanese patent documents in CPI (Sections A-M).

From 1982, unexamined specifications having an International Patent Classification (IPC) in Section H (Electricity) have also been included for EPI (Sections S-X).

From update 198527, Japanese patents included in CPI having an IPC in Section G (Physics) have also been classified and given Manual Codes in EPI.

Japanese patent documents corresponding to Sections P and Q (EngPI) only were not included in Derwent World Patents Index before 1995. During 1995, Japanese coverage was increased, in phases, to give complete coverage of all unexamined patents (Kokai) by the end of 1995.

In 1996, Thomson Reuters (Scientific) began covering Toroku documents, which are granted specifications with a post-grant opposition period.

From 2008 Japanese Utility Models are covered with the same level of detail as the patent records with documentation abstracts and deep indexing for records that are classified into Derwent sections A- Polymers and Plastics, B – Pharmaceuticals, C – Agriculture Chemicals, and E – General Chemicals. All other sections have DWPI alerting abstracts with manual coding. Each of the Japanese patents in the DWPI member level (the individual patents in the patent family) also include the machine translation of the author title, author abstract and first claim.

More details of Japanese coverage are given in the Appendix.

China

Coverage of Chinese patent publications commenced in 1985 with re-written English language titles, abstracts and classifications. This was enhanced in October 2007 with the addition of more detailed abstracts. In order to provide broader coverage of China's growing patent activity, also Chinese Utility Model Registration records have been added recently to Derwent World Patents Index (DWPI), initially beginning with documents published on October 3, 2007. These included bibliographic information (patent number, filing dates, IPCs, inventor and assignee names), Patentee codes and English-language translations of the author, title, abstract and first claim (all records human translated). DWPI Deep Indexing was applied to any Chinese Invention Patents or Chinese Utility Models published from 2nd January 2008 onwards for polymer, pharmaceutical, agrochemical and general chemical inventions in classification sections ABCDE. For all Chinese Invention Patents (Unexamined Applications) and Utility Models published from July 9, 2008 English translations of all claims can be searched and displayed. In early 2010 Chinese Utility Model coverage was being extended back to January 2007. Each record includes a full DWPI title, abstract and manual coding. Translations of the 1st claim for all of the Chinese Granted patents published from January 2011 will become available in 2011. Hong Kong granted patents, short-term patents and published applications are being covered from 2011.

India

Indian patent publications (both pre-grant applications and granted patents) with a publication date of January 2000 onwards have been covered appearing from update 200531 for all CPI and EPI/EngPI sections.

Korea

Korean patent publications have been covered since 1986 (198640). Korean Patents and Utility Models published from January 2008 (update 200851) include

- DWPI title, abstract, manual coding and deep indexing for records with significant chemistry content.
- Machine translations of all claims for Korean unexamined and examined applications, and Utility Models in the DWPI family can be searched and displayed.
- Machine translations of the author title and abstract for all Korean patents in the DWPI family.
- Full value-add for Korean unexamined and examined applications identified as basics in DWPI. This includes DWPI titles and abstracts (documentation abstract for records with significant chemistry content) written according to the Thomson Reuters (Scientific) editorial rules. Deep indexing is applied to records in sections A, B, C, and E that have significant chemistry coverage.

Taiwan

Taiwanese patent publications have been covered since 1993 (199324). The documents according to the revised patent law for patents published from August 1, 2004 onwards appeared from March 2005.

From DWPI Update 200907 the coverage was increased to comprise Taiwan Unexamined Applications (TW A) and Taiwan Utility Models (TW U)

English language titles and abstracts are provided for the Taiwan Unexamined Applications that are identified as Basics in DWPI, while for the Taiwan Utility Models an English Language title is included for all Basic records. These enhancements provide a more complete coverage of Taiwan in DWPI, as the Granted patents are already been covered, and Unexamined Applications were covered prior to December 2004.

The enhanced coverage started with the Taiwan Unexamined Applications, Granted Patents and Utility Models published from January 2008, with the first records appearing in DWPI from DWPI Update 200907.

- A Examined patent (old law) from 1993 to August 1, 2004
- A Unexamined application (new law) from 200553 for publications from August 1, 2004 to December 16, 2004
- B1 Granted patent (new law) from 200516 for publication from August 1, 2004
- A Unexamined application (new law) from 200907 for publications from January 2008
- U Utility Models appearing from 200907 for publications from January 2000

Philippines

Philippine granted patents have been covered since January 1992. Published patent applications and utility models have been covered since January 2010 appearing from update 201057.

Basics include DWPI titles and abstracts and relevant manual coding.

Malaysia

Malaysian patent granted publications including utility innovations have been covered since 2010.

Basics include DWPI titles and abstracts and relevant manual coding. Sections ABCE have deep indexing applied – polymer indexing, fragmentation codes and/or DCR indexing.

Thailand

Thai granted patent publications have been covered since 2010.

Basics include DWPI titles and abstracts and relevant manual coding. Sections ABCE have deep indexing applied – polymer indexing, fragmentation codes and/or DCR indexing.

Vietnam

Vietnamese publications for published applications and granted patents have been covered since 2010.

Basics include DWPI titles and abstracts and relevant manual coding. Sections ABCE have deep indexing applied – polymer indexing, fragmentation codes and/or DCR indexing.

Features

- Provides access to information from more than 44 million patents from 47 patent issuing authorities, giving details of over 20 million inventions.
- Invention documents as well as individual publication records are seamlessly integrated in one database.
- Contains bibliographic data, value-added titles, abstracts, general indexing and, where appropriate, in-depth chemical and polymer indexing.
- Documentation abstracts are available for the period between 1995 and 1999.
- All value-added text data are indexed in the basic index without stopwords. Simultaneous left and right truncation is optionally available.
- All first level text data is searchable in the basic index extension.
- Support for searching plurals, abbreviations and spelling variations is available.
- The bibliographic information is extensively standardised.
- Extensive cross-filing capabilities, e.g. DPCI has the same accession number as DWPI.
- The patent office's indexing is periodically revised: IPC, ECLA, FI/F-Terms, NCL
- Extra data is available for individual patent publications like author abstracts and claims or original patent assignee names and addresses.
- All information pertaining to an individual publication is separately searchable.
- Value-added and first level data can be searched in combination.
- Several thesauri help navigating through the maze of search terms.
- Electrical and engineering drawings are present in records dating back to 1988, and chemical structure drawings are present in records dating back to 1992.
- An integrated structure searchable chemical repository now containing more than 1.7 million chemical compounds has been available since 1999.
- Updated every 3 to 4 days (82 updates per year)

AB WO 2000069998 A1 UPAB: 20050524
 NOVELTY - An additive combination comprises an ethylene vinyl acetate isobutylene terpolymer, and at least one component from maleic anhydride alpha-olefin copolymer, polyimide or an alkyl phenol.
 DETAILED DESCRIPTION - Additive composition comprises an ethylene vinyl acetate isobutylene terpolymer (C1), and at least one maleic anhydride alpha-olefin copolymer (C2) of formula (I), a polyimide component (C3) of formula (II) or an alkyl phenol (C4) of formula (III).
 R = 16-40C hydrocarbon (at least 60 weight%);
 n = 2 - 8;
 R = 20-40C hydrocarbon (at least 60 weight%);
 R' = 16-18C hydrocarbon (at least 80 weight%);
 RAP = 20-24C hydrocarbon (at least 90 weight%) and/or 24-28C hydrocarbon (at least 70 weight%).
 An INDEPENDENT CLAIM is also included for a distillate fuel composition comprising a major proportion of a distillate fuel and the additive component.
 USE - As cold flow improvers for distillate fuel compositions such as middle distillate fuel, number 2 diesel fuel or hard-to-treat fuel (claimed).
 ADVANTAGE - The additives provide improvement in cold flow properties such as cold filter plugging point and pour point depression of distillate fuels.

TECH POLYMERS - Preferred Components: (C1) has a weight average molecular weight (Mw) from about 1,500 - 18,000 (preferably 3000 - 12000), number average molecular weight (Mn) from about 400 - 3000 (preferably 1500 - 2500) and vinyl acetate content from about 25 - 55 wt.%. The ratio of Mw to Mn is from 1.5 - 6. The concentration of terpolymer is from about 10 - 1000 parts per million (ppm) by weight of the distillate fuel. (C2) has a number average molecular weight from about 1000 - 5000. (C2) and (C3) are derived from substantially equimolar proportions of maleic anhydride and alpha-olefin. (C3) has a number average molecular weight from 1000 - 8000.
 ORGANIC CHEMISTRY - Preferred Composition: The distillate fuel composition additionally contains an ethylene vinyl acetate copolymer component (from about 5 - 250 ppm).

ABEX DEFINITIONS - Preferred Definitions: - R, R' = 22-38C hydrocarbon (at least 80 wt.%); - R' = 16-18C hydrocarbon (at least 90 wt.%); - RAP = 24-28C hydrocarbon (at least 80 wt.%).
 EXAMPLE - Three additive compositions were prepared using terpolymer (T1) with a vinyl content of 37 wt.%, maleic copolymer (M1) containing (wt.%) 22-26C (46.4), 28-38C (36.3), 40-48C (9.6), 50-58C (5.9) and 60-76C hydrocarbon (1.8) and/or alkyl phenol (A1) containing 24C (18.3), 26C (42.6), 28C (19.6), 30-40C (14), 42-50C (3.2), 52-60C (1.8) and 62-78C hydrocarbon (0.4). The compositions were as follows (ppm): (A) (T1) (225) and (M1) (25); (B) (T1) (225) and (A1) (25); and (C) (T1) (225), (A1) (20) and (M1) (5). This additives were mixed with fuel and tested for cold filter plugging point (CFPP). The results showed (CFPP) (degreesC) of -33,

-32 and -39.5 for (A), (B) and (C) respectively.

ABEN An additive combination for distillate fuels and a fuel composition
having improved cold flow properties. The additive combination is
incorporated into a major proportion of distillate fuel and is comprised
of an ethylene vinyl acetate isobutylene terpolymer in combination with
one or more of a maleic anhydride .alpha.-olefin copolymer component, a
polyimide component, and an alkyl phenol component each having one or
more hydrocarbon substituents within specified carbon number ranges.
Optionally, an ethylene vinyl acetate copolymer may also be incorporated
as a component therein.

ABFR Cette invention concerne une combinaison d'additif pour carburants
distilles et une composition de carburant aux caracteristiques
d'ecoulement a froid ameliorees. Cette combinaison d'additif, que l'on
integre dans une fraction importante d'un carburant distille, se compose
d'un ethylene vinyl acetate isobutylene terpolymere avec un ou plusieurs
composants anhydride maleique .alpha.-olefine copolymere, un composant
polyimide et un composant alkyl phenol, chacun de ces composants ayant un
ou plusieurs substituants d'hydrocarbure avec un nombre determine
d'atomes de carbone. Il est egalement possible d'y integrer un composant
supplementaire sous forme d'ethylene vinyl acetate copolymere.

The hierarchy of data

The document structure and its address system

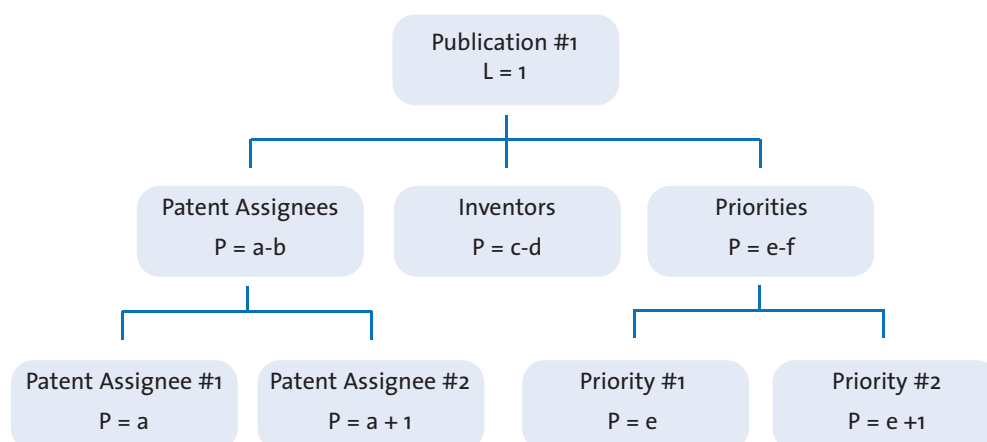

Database design is all about addresses: Each portion of information receives its unique address, the assignment of the addresses being consistent and transparent to allow unimpeded retrieval of this information. For STN users the framework of this address system hinges on proximity values on four proximity levels: L, P, S and W. While the absolute values don't matter at all to the user, the logical organisation of data laid down by these proximity values do. Employing Boolean operators may sometimes be sufficient to meet the selectivity requirements in particular if one is fortunate enough to wield very specific terms, but with the increasing amount of data to sift through forging selective strategies leveraging appropriate proximity operators may pay off. Operators questioning the proximity values are (L), (P), (S), and for the bottom level: (A), (W) and (T). Please note that the proximity levels are strictly hierarchical: Only if all higher level proximity levels match, the lower ones are considered for evaluation.

Please note that the enhanced polymer indexing, polymer coding and chemical coding reside outside the realm of the general proximity layout regime, because they consume all available levels of proximity already and there is only one set of codes for each invention. The proximity assignment in the DCR part of the WPI shall also not be considered here.

Link proximity

Since collated invention information and individual patent publication records needed to be accommodated within the same document identified by a Derwent accession number, the hierarchically highest level of proximity had to be sacrificed to organize these two different entities into one uniform document. Therefore the collated invention information received one distinct L-proximity value (L=0), and the data pertaining to the individual publications received another distinct L-proximity value each (L=1-n). When using the L-proximity operator to question the proximity value, one confines the search terms in question to either an individual publication or the collated invention. In order to enable addressing either an individual publication or the invention, a toggle was introduced in the form of terms 'publication' or 'invention' indexed in a search field for the document level (/DLVL) with the appropriate L-value.

Paragraph proximity

The collated invention information as well as the individual publication information is divided into logical units or sections. The logical units of interest to the user with reference to the proximity assignment are:

- Additional Accession Numbers
- Patent Assignees
- Inventors
- Publications
- Application Details
- Related Details
- Priority Details
- International Patent Classification
- International Patent Classification (Original)
- USPTO Classification (Issued)
- USPTO Classification
- European Patent Classification
- Japanese Patent Classification
- Derwent Enhanced Title
- Enhanced Abstract
- Documentation Abstract
- Derwent Classes
- Chemical Manual Codes
- Engineering Manual Codes
- Electrical and Electronic Manual Codes
- Keyword Indexing
- Agents
- Author title
- Author abstract
- Claims Structure

(The enhanced polymer indexing, polymer coding and chemical coding are not listed)

Each logical unit owns a distinct set of paragraph proximity values, Subelements, like the information pertaining to an individual patent assignee, receive distinct paragraph values. This enables one to use the paragraph proximity operator to assemble data pertaining to an individual patent assignee, e.g. address information and name. In this sense one (P) has been assigned to the following entities:

- Each Patent Assignee comprising PA(.aaa), PACO, PAO, PAA(.aaa)
- Each Inventor comprising IN(.aaa), INO, INA(.aaa)
- Each publication comprising PC, PN, PK, DW, LA, PGN, DRWN, PD, PY, PT, DS (IICM deprecated)
- Each application detail comprising AC, AP, AP.YR, APTS, APT, AD, AY, PC, PK, PN, PNK
- Each filing detail comprising FDT(.aaa), PC, PN, PK
- Each priority comprising PRC, PRN, PRN.YR, PRD, PRDF, PRTS, PRY, PRYF
- Each IPC potentially comprising IC, ICM, ICS, ICI, ICA, MGR, SGR, IPC(.aaa)
- Each initial IPC comprising IIC, IICM, IICS, IICI, IICA, MGR, SGR, IPC(.aaa)
- Each US National Classification NCL, NCLM, NCLS
- Each European Patent Classification EPC
- Each Japanese Patent Classification FCL, FTERM
- The enhanced title comprising TI, AW, TT
- Each enhanced abstract section: ALE, USE, ADV, UADV, NOV, DETD, ACTV, ACTN, USE, DRWD

- The technology focus section: TECH
- Each abstract extension section: ABEX (.aaa)
- Each documentation abstract section: ABDT(.aaa)
- The Derwent Classifications: DC
- The Derwent Chemical Manual Codes in MC
- The Derwent Engineering Manual Codes in MC
- The Derwent Electrical&Electronic Manual Codes in MC
- Each indexing terms paragraph in IT
- Each issued US national classification type: INCL, INCLM and INCLS
- Each agent comprising AG(.T), AGA(.aaa)
- Each author title: TIDE, TIEN, TIES, TIFR, TLM
- Each author abstract: ABDE, ABEN, ABFR, SLM
- Each main claim or set of claims: CLMDE, CLMEN, CLMFR, SLM

Use (P) proximity to confine searches to sub-elements of logical units like patent publication data pertaining to an individual patent publication.

Sentence proximity

Sentence proximity has been assigned to sub-divisions of the paragraphs given above. Areas where this is of significance for users are:

- One (S) for each Patent Assignee name
- One (S) for each Patent Assignee address, limitation, residence, nationality
- One (S) for each Inventor name
- One (S) for each Inventor address, residence, nationality
- One (S) for linked ICI codes
- One (S) for each title part, title terms and additional words
- One (S) for each enhanced abstract, technology focus, abstract extension or documentation abstract paragraph as designated by Thomson Reuters (Scientific) (these can be fairly short)

Use the (S) proximity operator to confine the searches to the patent assignee name or a part of the title.

Word proximity

Word-proximity has literally been assigned to each word where 'word' is sometimes synonymous with the finest granularity information unit, e.g. one IPC or chemical code. This has implications for the positive identification of search terms (highlighting), but can also be a powerful base for retrieval using the various operators questioning (W). Using SLART (Simultaneous Left And Right Truncation) in conjunction with the (T) Term operator it is possible to assemble word terms from its constituent fragments.

Use (A) and (W) proximity operators for interrogating adjacent or following word proximities. Use (T) for assembling words from fragments, and for attaching roles to structure identifiers.

The Basic Index

The Basic Index (/BI) at STN generally conveniently gathers all words from value-added text into one field and permits general subject searching without the necessity of using search qualifiers. In DWPI it contains single words from the Thomson Reuters (Scientific) value-add title, title terms, additional words, abstracts, technology focus, abstract extensions and documentation abstracts. Punctuation has been removed from the index. In addition simultaneous left-and-right truncation (SLART) is allowed in the basic index. Please note that the truncated stem has to consist of at least four characters when left truncation is used.

First-level data like the author titles, abstracts and claims have been indexed in a similar, but separate, segment of the index: the basic index extension (/BIEX).

Combine single words with Boolean and/or Proximity operators (W), (A), (S), (P) or (L). (W) is implied if no operator is input. (S) will confine search terms to a single text paragraph, (P) to a section of the abstracts, e.g. USE. (L) will act like an AND operator in the entire Basic Index, yet it may be useful in order to combine the statement with additional search terms and the document level indicator.

The Basic Index contains single words from the fields above without punctuation.

A "word" is defined as any alphabetic or numeric character(s) separated by a space or non-alphanumeric character. Hyphenated words from title terms and additional words are searchable as the separate single words and as the hyphenated words e.g. X-RAY; X RAY.

There are no stopwords. This means that words such as A, AN, AND, AS, AT, BY, FOR, FROM, IN, IS, NOT, OF, ON, OR, THE, TO, WHICH and WITH have also been indexed.

Spelling Variations

Prior to 1999, British spelling is generally used in DWPI but American spelling is also present in some of the fields making up the Basic Index. From 1999, American spelling (with British terminology) was adopted. As a precaution, both spellings should be covered in the search strategy to ensure complete retrieval:

```
=> S ALUMINIUM OR ALUMINUM
```

Alternatively STN provides a feature taking care of spelling variations. It is activated by the SET SPELLING ON command.

```
=> set spe on
SET COMMAND COMPLETED

      ((ALUMINIUM(W) SULPHATE)/BIEX)
L1     6776 ALUMINIUM SULPHATE/BI,BIEX
```

Plurals/Abbreviations

Many commonly occurring words in titles and abstracts are abbreviated. Further abbreviations like units of measurement, electrical and engineering elements, chemical groups and chemical formulae are used in abstracts. See Appendix for a list of abbreviations. However, all standard (and non-standard) abbreviations are automatically taken into account with the SET ABBREVIATIONS ON command. This is also true for plurals with the SET PLURALS ON function.

```

Searching for inventions

The entry point into the DWPI database may for instance be a document identifier like a patent publication number, or a patent assignee's or inventor's name, a text query, a deep indexing profile or a structure query. Once a relevant document has been identified this can be used to fan out to related patent documents by leveraging the various indexing schemes available. In the following a few illustrative examples may serve to indicate possible procedures.

Worked Examples

Text Queries

Retrieve the terms 'catalytic' and 'hydrogenation' when they are appearing in the same paragraph/sentence:

Text terms can be confined to the same paragraph/sentence by using the Sentence-Proximity operator.

```
=> s catalytic (S) hydrogenation
      78829 CATALYTIC
      36577 HYDROGENATION
L3    6460 CATALYTIC (S) HYDROGENATION

      (Ru(CH3COO-)2(6-methoxy-2-naphthyl)-MeOBIPHEP) or (Ru(CF3COO-)2(6-methoxy-
      2-naphthyl)-MeOBIPHEP). Preferred Process: The catalytic hydrogenation
      is carried out at a pressure of 1-150 bar, preferably at 10-100 bar and at
      a temperature of 10-100 degrees C, preferably 20-80 degrees C. The
      catalytic hydrogenation is carried out in the presence of a base such
      as triethyl amine, diisopropylethylamine (both preferred),
      diisopropylamine, benzylamine, 1-phenyl-benzylamine, (R).. . .
```

Search for benzoquinoline compounds in the title

Words can be assembled from constituent fragments by using the Term-Proximity operator:

```

 NOVELTY - Preparing a mutated, highly pathogenic avian influenza virus
 (A).
 DETAILED DESCRIPTION - Preparing a mutated, highly pathogenic avian
 influenza virus (A) comprises:
 (A) culture and isolation of (A);
 (B) mutagenesis of a plasmid (P) that contains a cDNA insert which
 carries the hemagglutinin gene (I) of (A);
 C) transfecting cells with:
 (i) four plasmids that provide expression of the RNA-polymerase II
 proteins PB1, PB2, PA and NP of (A);
 (ii) 7 plasmids for expression of the RNA-polymerase I proteins
 PB1, PB2, PA, NP, NA, M and NS of (A) and
 (iii) mutated (P);
 (D) releasing the virus formed and
 (E) replication of this virus.
 An INDEPENDENT CLAIM is also included for a vaccine against (A) of
 subtype H7 that consists of mutated (A) that is immunogenic but not
 pathogenic.
 ACTIVITY - Virucide.
 MECHANISM OF ACTION - Vaccine.
 When 10 hens were inoculated intravenously with wild-type
 A/FPV/Rostock/34, all became ill and 7 died. When a mutant virus that had
 a modified hemagglutinin cleavage site (ProGluSerLysGlyArgGlyLeuPhe) was
 used instead, no birds became ill, but all expressed antibodies against
 hemagglutinin.
 USE - (A) is useful in vaccines to protect against influenza, in
 vertebrates, specifically mammals or birds (claimed), including humans.
 ADVANTAGE - Mutation of the hemagglutinin gene generates a virus
 that remains immunogenic but is no longer pathogenic. Since the mutated
 virus is of avian origin, it can be replicated efficiently in eggs without
 requiring any additional virus and without risk of the mutant reverting
 back to the wild type.

...

Structure Query

Search for a chemical compound structure and retrieve the corresponding bibliographies.

Build a structure (here employing a built-in template for brevity):

```
=> stru penicl
ENTER (DIS), GRA, NOD, BON OR ?:. .

Display and Print Formats

In DWPI various predefined formats including STD, BIB and ALL can be used to display search results online or print search results offline (for a complete list refer to the reference part). Some formats (e.g. ALL) are also available as so-called indented version (e.g. IALL). The indented format includes the same information as the corresponding 'standard' format, but the display field codes preceding the information are replaced by the complete field names.

For the display of individual patent publication data a separate set for predefined display formats is being used, for instance MEMB or MEMBG.

For the display of data containing document identification numbers like PI, ADT or PRAI etc. two different display options are being offered: STN and Derwent Standard Displays. These can be chosen by the SET PATent command.

In addition to the predefined formats, any combination of display fields and formats may be used to display or print answers. Multiple codes must be separated by commas or spaces, e.g. => D L4 1-5 IN TI. The order of the terms in the formats is not important, but information will be displayed in the same order as input. Hit terms will be highlighted in all fields.

For records that include an image there are ten predefined formats: ALLG, IALLG, BRIEFG, IBRIEFG, FULLG, IFULLG, MAXG, IMAXG, MEMBG, and MEMBFG.

Users can create their own predefined formats with the SET FORMAT command. System predefined and/or any of the display fields can be part of such a user predefined format.

Special display formats are available for use with hit-term highlighting. They can be used alone or with other fields or predefined formats for displaying search results.

Format	Definition
HIT	All fields containing hit terms
HITCODE	Displays all codings which led to the retrieval of the document
HITCMC	Displays all chemical codings which led to the retrieval of the document
HITPLC	Displays all polymer codings which led to the retrieval of the document
HITPLE	Displays all enhanced polymer codings which led to the retrieval of the document
HITSTR	Displays the DCR record which led to the retrieval of the bibliographic record (including DCSE, CN.P, CN.S, STR, SDCN, SDRN)
FRAGHITSTR	Displays the DCR record which corresponds to the chemical coding (including DCRs, DCNs, RINs etc.) which led to the retrieval of the bibliographic record.
KWIC	All hit terms plus a maximum of 50 words on either side
OCC	List of display fields containing hit terms

All of the formats except for all HIT formats, KWIC, and OCC may be used with the DISPLAY ACC command to display the record for a specified accession number, and with the PRINT ACC command to print accession number records offline.

The XML distribution format has additionally been provided for users wanting to perform extensive post-processing on the result sets. A => D XMLDOC will result in a hypertext link to a compressed XML file.

```
=> d xmldoc
```

```
L5 ANSWER 1 OF 1 WPIX COPYRIGHT 2011 THOMSON REUTERS on STN
XMLDOC
http://www.stn-international.org/xd/183673465677/WPIX1999-123456.xml.zip
Links will expire 90 days from the date this display was created. Be sure to
save your results.
```

Select and Sort

The Select command allows to extract terms from the display for analysis or for further search purposes. TI is the default field code for SELECT. If no other field is specified single words from the title are selected automatically.

Sort can be employed to sort the answers in an answer set according to various criteria, e.g. IPC, rather than the chronological sequence according to the primary key or accession number in descending order.

For a complete list of select and sort codes please refer to the reference part.

Current awareness searching

Current awareness searching can be conducted in DWPI either by setting up an SDI or running your own scripts. SDIs can be set up to deliver the results in hardcopy or softcopy form or as an online answer set delivered to your online account. The latter is recommended for structure SDIs since a subsequent crossover into the bibliographic segment is usually required. Below the general procedure to set an SDI up is illustrated. Structure SDIs are being dealt with in the DCR Manual.

Create an answer set:

```
=> s harder
L1          7306 HARDER
```

Evaluate the results:

```
=> d kwic

L1 ANSWER 1 OF 7306 WPIX COPYRIGHT 2011 THOMSON REUTERS on STN
TI. . . region of boss and hole to fix boss securely in hole and secure
parts together, where material of part is harder than that of other part
NOV. . . . to fix the boss securely in the hole and secure the parts
together, where material of the part (10) is harder than that of the
other part (12).
```

Set up an SDI based on the query L1:

```
=> sdi
ENTER QUERY L# FOR SDI REQUEST OR (END):L1
ENTER UPDATE FIELD CODE (UP) OR ?:.
ENTER SDI REQUEST NAME, (AA001/S), OR END:TEST1/s
ENTER COST CENTER (NONE) OR NONE:.
ENTER TITLE (NONE):just another test
ENTER METHOD OF DELIVERY (OFFLINE), ONLINE, OR EMAIL:EMAIL
ENTER EMAIL ID (821K):test@fiz-karlsruhe.de
TEST@FIZ-KARLSRUHE.DE
RECEIVE DELIVERY NOTIFICATION? (Y)/N:n
ELIMINATE PREVIOUSLY SEEN ANSWERS WITH EACH SDI RUN? Y/(N):.
ENTER PRINT FORMAT (STD) OR ?:FULL
HIGHLIGHT HIT TERMS? (Y)/N:.

WPI Invention Display Formats

Format	Content
STD (default)	all bibliographic data: AN, CR, DNC, DNN, TI, DC, IN, PA, CYC, PN, ADT, FDT, PRAI, IPC, IPCI, IPCR.
ISTD	all bibliographic data: AN, CR, DNC, DNN, TI, DC, IN, PA, CYC, PN, ADT, FDT, PRAI, IPC, IPCI, IPCR Indented version.
BIB	all bibliographic data but without the IPCs and main IPC in the PI field: AN, CR, DNC, DNN, TI, DC, IN, PA, CYC, PIA, ADT, FDT, PRAI.
IBIB	all bibliographic data but without the IPCs and main IPC in the PI field: AN, CR, DNC, DNN, TI, DC, IN, PA, CYC, PIA, ADT, FDT, PRAI. Indented version.
ABEQ	all equivalent abstracts.
ABS	abstract, all equivalent abstracts and accession number: AN, CR, AB, ABEQ
CODE (syn IND)	accession number, cross references, title, DERWENT class, international patent classification, manual code, DERWENT registry, polymer code, polymer indexing code and chemical code: AN, DC, IPC, IPCI, IPCR, EPC, ICO, NCL, FCL, FTRM, MC, IT, DRN, PLC, PLE, CMC
SCAN	AN**,TI (* = WPIX and WPIDS only)
TRIAL	depending on logical file
TRIAL is to SAMPLE MC.	WPINDEX: AN, CR, ANX, DNC, DNN, TT, DC, IPCI, IPCR, IPCI, IPCR, EPC, ICO, NCL, FCL, FTRM, MC. synonymous WPIDS/WPIX: AN, CR, ANX, DNC, DNN, TI, DC, IPCI, IPCR, IPCI, IPCR, EPC, ICO, NCL, FCL, FTRM,
ANL	Accession Number List only
SUM	AN, TI, NOV
FAM	PI, ADT, PRAI, FDT
BASIC	all invention level data available for a given basic patent: AN, CR, ANX, DNC, DNN, TI, DC, IN, PA, PNC, CYC, PN.B, ADT.B, PRAI, AB, FS, FA.
BRIEF	AN, CR, ANX, DNC, DNN, TI, DC, PA, AB
IBRIEF	AN, CR, ANX, DNC, DNN, TI, DC, PA, AB. Indented and formatted version.
BRIEFG	AN, CR, ANX, DNC, DNN, TI, DC, PA, GI, AB
FULL	all invention level data available for a given record including TECH and ABEX with the exception of the equivalent abstracts and the chemical, polymer and polymer indexing coding: AN, CR, ANX, DNC, DNN, TI, DC, IN, PA, CYC, PN, ADT, FDT, PRAI, IPC, IPCI, IPCR, EPC, ICO, NCL, FCL, FTRM, AB, FS, FA, MC, TECH, ABEX, ABDT. Short version.
IFULL	all invention level data available for a given record including TECH and ABEX with the exception of the equivalent abstracts and the chemical, polymer and polymer indexing plasdac coding: AN, CR, ANX, DNC, DNN, TI, DC, IN, PA, CYC, PN, ADT, FDT, PRAI, IPC, IPCI, IPCR, EPC, ICO, NCL, FCL, FTRM, AB, FS, FA, MC, TECH, ABEX, ABDT. Indented and formatted version.

Format	Content
FULLG	<p>all invention level data available on a given record including TECH and ABEX with the exception of the equivalent abstracts and the chemical, polymer and polymer indexing coding: AN, CR, ANX, DNC, DNN, TI, DC, IN, PA, CYC, PN, ADT, FDT, PRAI, IPC, IPCI, IPCR, EPC, ICO, NCL, FCL, FTERM, GI, AB, FS, FA, MC, TECH, ABEX, ABDT.</p> <p>Short version plus image.</p>
IFULLG	<p>all invention level data available for a given record including TECH and ABEX with the exception of the equivalent abstracts and the chemical, polymer and polymer indexing coding: AN, CR, ANX, DNC, DNN, TI, DC, IN, PA, CYC, PN, ADT, FDT, PRAI, IPC, IPCI, IPCR, EPC, ICO, NCL, FCL, FTERM, GI, AB, FS, FA, MC, TECH, ABEX, ABDT.</p> <p>Indented and formatted version plus image.</p>
ALL	<p>all invention level data available for a given record with the exception of TECH, ABEX, the equivalent abstracts and the chemical, polymer and polymer indexing coding: AN, CR, ANX, DNC, DNN, TI, DC, IN, PA, CYC, PN, ADT, FDT, PRAI, IPC, IPCI, IPCR, EPC, ICO, NCL, FCL, FTERM, AB, FS, FA, MC.</p> <p>Short version.</p>
IALL	<p>all invention level data available for a given record with the exception of TECH, ABEX, the equivalent abstracts and the chemical, polymer and polymer indexing coding: AN, CR, ANX, DNC, DNN, TI, DC, IN, PA, CYC, PN, ADT, FDT, PRAI, IPC, IPCI, IPCR, EPC, ICO, NCL, FCL, FTERM, AB, FS, FA, MC.</p> <p>Indented and formatted version.</p>
ALLG	<p>all invention level data available on a given record with the exception of TECH, ABEX, the equivalent abstracts and the chemical, polymer and polymer indexing coding: AN, CR, ANX, DNC, DNN, TI, DC, IN, PA, CYC, PN, ADT, FDT, PRAI, IPC, IPCI, IPCR, EPC, ICO, NCL, FTERM, GI, AB, FS, FA, MC.</p> <p>Short version plus image.</p>
IALLG	<p>all invention level data available for a given record but the record with the exception of TECH, ABEX, the equivalent abstracts and the chemical, polymer and polymer indexing coding: AN, CR, ANX, DNC, DNN, TI, DC, IN, PA, CYC, PN, ADT, FDT, PRAI, IPC, IPCI, IPCR, EPC, ICO, NCL, FCL, FTERM, GI, AB, FS, FA, MC.</p> <p>Indented and formatted version plus image.</p>
DALL	<p>all invention level data available for a given record with the exception of TECH, ABEX, the equivalent abstracts and the chemical, polymer and polymer indexing coding: AN, CR, ANX, DNC, DNN, TI, DC, IN, PA, CYC, PN, ADT, FDT, PRAI, IPC, IPCI, IPCR, EPC, ICO, NCL, FTERM, AB, FS, FA, MC.</p> <p>Delimited version.</p>
MAX	<p>all invention level data available for a given record including equivalent abstracts and chemical, polymer and polymer indexing coding as well as documentation Abstract data and all patent member specific data: AN, ED, CR, ANX, DNC, DNN, TI, AW, DC, IN, PA, CYC, PN, ADT, FDT, PRAI, IPC, IPCI, IPCR, EPC, ICO, NCL, FCL, FTERM, AB, TECH, ABEX, ABEQ, ABDT, IT, FS, FA, MC, DRN, PLC, PLE, CMC.</p>
MAXG	<p>all invention level data available for a given record including equivalent abstracts and chemical, polymer and polymer indexing coding: AN, ED, CR, ANX, DNC, DNN, TI, AW, DC, IN, PA, CYC, PN, ADT, FDT, PRAI, IPC, IPCI, IPCR, EPC, ICO, NCL, FCL, FTERM, GI, GINF, AB, TECH, ABEX, ABEQ, ABDT, IT, FS, FA, MC, DRN, PLC, PLE, CMC.</p> <p>Short version plus image.</p>

Format	Content
IMAX	all invention level data available for a given record including equivalent abstracts and chemical, polymer and polymer indexing coding: AN, ED, CR, ANX, DNC, DNN, TI, AW, DC, IN, PA, CYC, PN, ADT, FDT, PRAI, IPC, IPCI, IPCR, EPC, ICO, NCL, FCL, FTERM, AB, TECH, ABEX, ABEQ, ABDT, IT, FS, FA, MC, DRN, PLC, PLE, CMC. Indented and formatted version.
IMAXG	all invention level data available for a given record including equivalent abstracts and chemical, polymer and polymer indexing coding: AN, ED, CR, ANX, DNC, DNN, TI, AW, DC, IN, PA, CYC, PN, ADT, FDT, PRAI, IPC, IPCI, IPCR, EPC, ICO, NCL, FCL, FTERM, GI, GINF, AB, TECH, PRIO, ABEX, ABEQ, ABDT, IT, FS, FA, MC, DRN, PLC, PLE, CMC. Indented and formatted version.
XMLDOC	all data available for a document in XML format with a wrapper including the Copyright and answer number line, start and closing tags. Each document constitutes well-formed XML validating against the Derwent DTD/Schema.
HITSTRucture	Displays the DCR hit record which led to the retrieval of the bibliographic record.
FRAGHITSTRucture	Displays the DCR record which corresponds to the chemical coding (including DCRs, DCNs, RINs etc.) which led to the retrieval of the bibliographic record.
HITCMC	Displays the chemical coding section which led to a hit
HITPLE	Displays the polymer indexing section which led to a hit
HITPLC	Displays the polymer coding section which led to a hit
HITCODE	Displays the coding sections which led to a hit

Additional formats: HIT, KWIC, OCC.

Document Identification

Primary Key

The DWPI Primary Accession Numbers are the basis for the unique and unambiguous document identifiers for the STN files WPIDS, WPIX and WPINDEX.

All new basics are assigned unique accession numbers in the order in which they were added to DWPI. Each number comprises a year element, a hyphen, and a six character serial number, but the format has changed slightly over time.

Beginning with update 200801 the DWPI accession numbers have a letter at the beginning of the serial to allow for more address space to potentially accommodate more documents. Hence the first new format accession number is 2008-A00001.

From 198327 until 200801 each year numbering began at 000001 with the new year-prefix. At update 198327, re-numbering began at 1983-700001.

From update 197001 to 198327 chemical Basics were assigned accession numbers that indicate the year of entry by a letter at the end of the number rather than the two-digit year prefix, e.g. 45982C. In order to standardize the format of these accession numbers online, the year and a hyphen have been inserted before the old format number, e.g. 1975-C7954W.

For non-chemical Basics from update 1970001 to 198327 Basics were assigned accession numbers which also had a letter added at the beginning of each number to distinguish them from chemical records.

The following numbers were used to indicate the year:

R	1970	W	1975	C	1980
S	1971	X	1976	D	1981
T	1972	Y	1977	E	1982 (updates 198201-198246)
U	1973	A	1978	J	1982 (updates 198247-198252)
V	1974	B	1979	K	1983 (updates 198301-198326)

Prior to 1970, accession numbers ended in a letter indicating the printed service where the record appeared. These letters have been assigned artificial year numbers have been added as prefixes to the accession numbers as follows:

F	FARMDOC (DWPI Section B)	1966
G OR H	AGDOC (DPWI SECTION C)	1967
P OR Q	PLASDOC (DWPI SECTION A)	1968
Z	"PRE-CPI" DATA	1969

The following table shows the format of the accession numbers in existing records, for reference.

Year	Update Range	CPI PANs	Non-CPI –PANs
1970	197001-197051	1970-00001R to 1970-95670R	
1971	197101-197151	1971-00001S to 1971-81761S	
1972	197201-197252	1972-00001T to 1972-82958T	
1973	197301-197352	1973-00001U to 1973-81444U	
1974	197401-197452	1974-00001V to 1974-90143V	1974-A0001V to 1974-M2941V
1975	197501-197552	1975-00001W to 1975-86863W	1975-A0001W to 1975-N8140W
1976	197601-197652	1976-00001X to 1976-98006X	1976-A0001X to 1976-M3809X
1977	197701-197751	1977-00001Y to 1977-91815Y	1977-A0001Y to 1977-L3671Y

2011	201101-	2011-A00001 onwards	

As from update 200906, the production of DWPI has moved over to a new Thomson Reuters (Scientific) Production System (TSPS). While there are no changes to data formats, there are some minor changes to the assignment of both primary accession numbers (PANs) and secondary accession numbers or document numbers (SANs).

PANs and SANs have until now been assigned to Basic records at the end of the production process. Once the data was extracted for a particular update, it was sorted by patent country and the PANs then assigned to the new Basics. Two series of SANs were then assigned to Chemical and Non-Chemical patents for the production of some of our legacy microform products.

In the new system, PANs are assigned as soon as each individual Basic is identified rather than after the update extraction. We will no longer sort the data by patent country before assigning the PANs and we have ceased applying SANs as we no longer produce the microform products to which they relate.

From 200907 there is a mixture of records completed in both the old and new production systems and this will continue for some time. Records from the new production system (TSPS) will commence with the PAN 2009-E00001. Records from the old production system (DPS) will follow on from the PANs generated up to 200905 (the last PAN provided in 200905 was 2009-A98116). This in effect means that there is a gap in the accession number sequence which is gradually filled as all the records loaded into the old production system are being completed. Also as a consequence of each Basic being sent as soon as it is ready, there will not be a continuous series of PANs in the range starting 2009-E00001 in each update.

Apart from the main accession numbers there are other types of accession numbers used in the DWPI database:

- Alternative Accession Number
- Secondary Derwent Accession Number
- Cross-Reference/Related Derwent Accession Number

Primary DWPI Accession Numbers

Qualifier

The main accession numbers can be used for display, search and sort (alphanumeric) purposes using the field code AN.

Content

Content and format of the accession number has been described above.

Search

Accession numbers can be searched with or without the hyphen, both with a two-digit or a four-digit year.

Secondary Accession Numbers

Qualifiers

The secondary accession numbers can be used for display, search and sort purposes using the field codes DN, DNC and DNN.

Content

Secondary Accession Numbers (document numbers) have been assigned to all records since the start of 1983 (update 198301) originally for the purpose of identifying records in microfilm series.

Secondary accession numbers of CPI documents (DWPI chemical sections A to M) are indexed with "C" before the year i.e. CYYYY-NNNNNN. Secondary accession numbers of records classified into the electrical and engineering sections (DWPI sections P, Q, S-X) are indexed with an "N" before the year, i.e. NYYYY-NNNNNN. If a record is classified into both chemical and non-chemical sections, it is assigned two document numbers, one in each series.

If a basic is reissued, a new secondary accession number is added within the reissue update. Also if an abstract is added to a record that originally did not have an abstract, a secondary accession number is then added.

From Update 200906 the secondary accession numbers have been discontinued since the microfilm editions they are referencing are no longer produced.

Search

CPI document numbers can be searched in format CYYYY-NNNNNN, and without hyphen as CYYY-YNNNNNN.

```
=> S C1990-166672/DNC
L9          1 C1990-166672/DNC
              (C90-166672/DNC)
```

Non-CPI document numbers are searchable in format NYYYY-NNNNNN, and without hyphen as NYYY-YNNNNNN (please note, that in this case the first "N", in front of the year, means letter N).

```
=> S N1990-001019/DNN
L10         1 N90-001019/DNN
```

Select

Document numbers are selected in format CYYYY-NNNNNN for CPI sections and in format NYYYY-NNNNNN for non-CPI sections.

Cross Reference Accession Number, Related Accession Number

Qualifiers

The cross reference accession numbers can be used for display, search and sort purposes using the field codes CR and its synonym XR.

Content

In Derwent World Patents Index, the priorities are used as the primary key to determine the equivalency of patent specifications. Basic documents have unique priority data at the time of receipt of the document by Thomson Reuters (Scientific). A patent document received at a later date which has further but related priorities will usually be made Basic and a new family created. This is not only because of the new priority information but also because there is usually extra information available in the later publications.

Since 1985, when an earlier priority carried by a record has already appeared as unique on a previous basic, all priorities have been cross-referenced in the related records.

Before 1985, relationships with families based on earlier priorities were not directly recorded and do not appear in the Cross Reference field. These relationships can,

however, be determined online by searching all of the priorities involved until no additional records are retrieved.

Occasionally, a patent input as a Basic is later found to be equivalent to an existing record. When this occurs, the relevant patent number is added to its correct patent family and the two records involved are both cross-referenced to each other with their respective Accession Numbers.

Prior to 2006 it was possible for related records to contain the same patent number resulting in the patent number appearing more than once within Derwent World Patents Index. This is no longer the case for both the backfile and newly added documents. Instead if any specific document is related to more than one family then this will be indicated by Cross Reference Accession Number(s). Consequently this means that any patent number will only appear once within Derwent World Patents Index.

Search

In /CR, accession numbers can be searched in formats YYYY-XNNNNX and YYYYXNNNNX. They are displayed with the update in format YYYY-XNNNNX.

```
=> S 1990-201216/AN,CR

Alternative Accession Numbers

Qualifiers

The alternative accession numbers can be used for display, search and sort purposes using the field code ANX.

Content

Additional accession numbers applied to pre-1970 data when each printed service had its own accession numbers are available within the Alternative Accession Number field, /ANX.

The pre-CPI data has not appeared in any printed journal and the pre-1970 accession numbers are not associated with any updates - the online file shows these updates with an Update Week as "oo".

Patent Assignee and Inventor Data

Patent Assignee (PA)

Qualifiers

The patent assignee name can be used for display, search and sort purposes using the following field codes:

Search /PA (Synonym /CS)
 Display PA
 Select PA, PAX
 Sort PA, alphanumeric

Content

The Patent Assignee field consists of the full name of the assignee, up to 40 characters in length, and the assignee code. Prior to update 199216 there was a limit of 24 characters in the assignee name. Both of these limits apply to the overall name, even if the name comprises several words.

Please note that the assignee name may be shortened or individual words abbreviated as necessary to fit the field length restrictions, e.g. "INT" for International. To find variations on assignee names use the Expand (E) command.

Until update 199216, up to four assignees from the basic patent were recorded. Since this time, this limit has been removed and any number of assignees may be input. From the end of 1976 (update 197648) additional assignee codes and names appearing on equivalents have also been added.

Approximately 21,000 companies which regularly file a large number of patent applications are regarded as "standard" companies and are assigned a unique four-letter code. For comprehensive retrieval of patents assigned to these standard companies, it is best to search the Patent Assignee Code field.

Search

Each patent assignee entry has been indexed as a 'Sentence' and implied (S) proximity is available. That means the (S) operator may be omitted and a blank between search terms is automatically treated as (S). As the following example shows, variations in names of organizations appear online. With regard to these variations the implied (S) proximity feature is very useful. Just enter single words (automatically combined with (S)) to receive complete coverage.

Patent assignee codes are indexed in the field /PACO.

Select and Sort

Patent assignees may be selected from answer sets and records may be sorted by the first patent assignee within records of an answer set.

The following example shows a patent assignee analysis of all new inventions of 2000 in Class A12, that

deals with di- and higher olefins, acetylenics, and nitroso compounds. The top ten patentees are displayed in order of occurrence (OCC). The top ten patentees can be displayed in order of record count using the command "D DOC":

```

Patent Assignee Code

Qualifiers

The patent assignee codes can be used for display, search and sort purposes using the following field codes:

Search /PACO
 Display PA
 Select PACO, PAX
 Sort PACO, alphanumeric

Content

Since corporate names are not standardized, but vary widely according to location and subsidiary, a single company code is assigned to patentees that are known to be related and that regularly file a large number of patents ("Standard" Companies).

Until 1992, a maximum of four codes were applied to each basic record. From update 199216 however, this restriction was lifted and any number of assignees are recorded. Also since update 197648, additional assignee codes and names have been added from equivalents if they differ from those of the Basic.

Standard Codes

Approximately 21,000 companies, which regularly file a large number of patent applications, are regarded as "standard" companies and are assigned a unique four letter code. For example BADI-C is the code for BASF AG and associated companies. Standard patent assignee codes appear in the Patent Assignee Codes user guide and are searchable on the Thomson Reuters (Scientific) website (<http://scientific.thomsonreuters.com/support/patents/dwpioref/reftools/companycodes/lookup/>).

	Suffix	Format
Standard Companies	C	AAAA-C

Although Standard Company codes have the C suffix attached in both the index and displays they can also be searched without the suffix.

If two organisations (with "Standard" patent assignee codes) merge, the usual policy is to continue to apply the standard patent assignee code for each organisation as long as patents filed under the names of the independent organisations continue to appear. For example, following the merger of Sandoz (SANO) and Ciba (CIBA) to form Novartis, the SANO and CIBA codes continued to be applied to those patents filed under the names of Sandoz and Ciba. These codes may ultimately become dormant if ongoing filings are made under the Novartis name for which a new standard code "NOVS" was created.

Note that a new standard company code is not automatically assigned when two large companies merge or are involved in for example, takeovers or demergers. Each case is assessed individually and the most appropriate action taken. So in the case of Novartis (merger) and Zeneca (demerger from ICI) new codes were created, but with SmithKline Beecham, Glaxo Wellcome, and GlaxoSmithKline one existing code was retained and the other abandoned.

Patentee codes are not generally changed retrospectively as the assignment of patent rights from one organisation to another are not tracked in DWPI.

Patent Assignee Code Dictionary

The list of company codes for patent assignees, both standard and non-standard codes, matched with company names is available in field /PACO (Patent Assignee Code). This feature allows easy and comprehensive identification of the company names associated with a code (both standard and non-standard codes), or the code(s) used for a company name. Expanding in field /PACO provides the alphabetical list of codes, single words and the full name from the company field (/PA). Each code is listed with its associated terms (AT) in the dictionary. The dictionary is periodically updated on a quarterly basis to reflect any developments in a timely fashion.

FIELD	RELATIONSHIP CODE	CONTENT	EXAMPLES
/PACO	ALL	All patent assignee code(s) defined for the name	E KODAK+ALL/PACO
	DEF	All name definitions for the given code	E EAST+DEF/PACO

Non-standard Codes

Since 1970, "non-standard" codes have been assigned to companies, institutes and individuals that do not file a large number of patents. These codes are allocated using a set of simple rules (see Patent Assignee Codes user guide) and the letters used in the non-standard codes are often the first four letters of the name. Thus these codes are often not unique and their usefulness in searching is limited.

Non-standard codes are displayed with a suffix indicating assignee status as follows:

Type	Suffix	Format	Scope
Non-standard Companies	N	AAAA-N	(197001- to date)
Russian (Soviet) Organisations	R	AAAA-R	(197001- to date)
Individuals	I	AAAA-I	(197001- to date)

Search

The following example shows searching for Bayer AG patents using the standard code FARB.

```

=> s FARB/PACO
L6      32401 FARB/PACO
      (FARB-C/PACO)

=> d ti pa 1-3

L6 ANSWER 1 OF 32401 WPIX COPYRIGHT 2011 THOMSON REUTERS on STN
TI New polymorph II of 4-(4-(((4-chloro-3-(trifluoromethyl)phenyl)carbamoyl)amino)-3-fluorophenoxy)-N-methylpyridine-2-carboxamide useful for the treatment of e.g. hyper-proliferative disorders, solid tumors and lymphomas
PA (FARB-C) BAYER HEALTHCARE AG

L6 ANSWER 2 OF 32401 WPIX COPYRIGHT 2011 THOMSON REUTERS on STN
TI Herbicide combination useful for weed control comprises amidosulfuron and a chloropyridine herbicide
PA (FARB-C) BAYER CROPSCIENCE AG

L6 ANSWER 3 OF 32401 WPIX COPYRIGHT 2011 THOMSON REUTERS on STN
TI New polymorph III of 4-(4-(((4-chloro-3-(trifluoromethyl)phenyl)carbamoyl)amino)-3-fluorophenoxy)-n-methylpyridine-2-carboxamide, is Raf kinase inhibitor useful to treat e.g. hyper-proliferative disorder, solid tumor and sarcoma
PA (FARB-C) BAYER HEALTHCARE AG

```

Sort

Search results may be sorted by the first assignee code. In the following answer set on patent documents in the area of lasers and masers (Derwent Class Vo8) published in or designated for Denmark, records are sorted by the patent assignee codes:

```

=> S V08/DC AND DK/PCS,AC,PRC
      83396 V08/DC
      1851841 DK/DS
      97594 DK/PC
      1936077 DK/PCS
              (DK/DS,PC)
      24435 DK/AC
      19549 DK/PRC
L1      8931 V08/DC AND DK/PCS,AC,PRC

=> sor paco 1-
SORT IS APPROXIMATELY 11% COMPLETE
SORT IS APPROXIMATELY 23% COMPLETE

(SONY-C) SONY CORP; (TSUK-I) TSUKIHARA K

```

Inventors

Qualifiers

The standardized inventor names can be used for display, search and sort purposes using the following field codes:

Search /IN (Synonym /AU)
 Display IN
 Select IN
 Sort IN, alphanumeric

Content

From update 197804 up to three inventor names were indexed from the basic patent, where this information was available. From 1980, up to eight inventors have been added, with the exception of Soviet/Russian basics, for which only three inventor names continue to be indexed. In this time period the family name was limited to 19 characters and the number of initials to 3.

Between 1992 and 2005, up to 99 inventors could be listed per record, but the limit on Russian inventors remains. The number of characters per family name increased to a maximum of 30 characters and there is no limit on initials.

From 2005 onwards this continued except that there is no longer a limit to the number of inventors per record.

Inventor names from Japanese Basics and equivalents have been included since update 200537.

Please note, there will be occasional records pre-197804 that have the IN field populated, however coverage is by no means complete.

Search

Inventor names are searched as complete (bound) phrases in the inverted format:

=> S Surname A B C/AU

where Surname = family name
 A B C = initials (with spaces).

When searching for single-word family names longer than 10 characters, the 10-character version entered into the file before update 199216 and the full name entered thereafter have to be included in the search strategy. Enter both versions of the family name in the search strategy or use EXPAND to select the appropriate entries.

=> E FUHRMEI/IN

```

It is possible to truncate a name immediately after the family name, when initials are not known, but this may decrease the precision of the search. Truncated names should be combined with other search terms.

Please note that inventors should also be searched as patent assignee, since if an individual is also listed as the patent assignee, the inventor name may appear only in the PA field. Note also that inventors may only use their first initial.

See PA field for further information on (S) proximity and bound phrases in this field.

Select

Inventors can be selected as bound phrase from answer sets with the SELECT IN command.

Publication Data (PI)

Publication data display is available in a condensed tabular format which includes various data elements characterizing a patent publication. The default display used in standard display formats is PN which doesn't comprise designated states for brevity while PI contains them.

Qualifiers

```
Search  /PC,/PC.B,/DS,/PCS,/PN,/PATS,/PK,/PK.B,/PNK,/PNK.B,/PD,/PD.B,
        /PY,/PY.B,/DW,/DW.B,/LA,/PG,/DRWN
Display PI,PI.B,PN,PN.B,PNK,PNK.B
Select  PC.B,PN syn PI,PN.B,PK,PK.B,PNK,PNK.B,PD,PD.B,PY,PY.B,DW,DW.B,LA
Sort    PC.B,PN.B,PK.B,PD.B,PY.B,DW.B
```

All data pertaining to one publication is listed on one line and can be linked by using the paragraph proximity operator (P).

Publication data may comprise the following data elements:

Patent Number

The patent publication number can be displayed in either of two different formats (STN standard display format or Derwent display format) as previously set according to the user's preferences. Both formats are searchable in the database with automatically adjusted search formats. The current standard patent publication formats can be found in the Appendix.

Distinguishing marks

Since some patent countries issue independently running number series and therefore potentially clashing document identifiers, some number series receive distinguishing marks in the index in order to avoid said clashes. These are currently utility model publications from Asia (China, Japan and Korea), but also granted patent publications from China (PRC and Taiwan).

Patent Publication Crossover Key

STN provides an unambiguous patent publication identification key for crossover purposes. It consists of the publication number in STN standard format appended by the kind code interspersed by a blank. It is recommended to use this key for crossover purposes instead of the publication number on its own. The keys for the basic publications are individually searchable.

```

The second character of the kind code is masked on search to allow for more complete recall.

Double Indexing

Since some patent numbers are decidedly different for STN and Derwent standard formats, sometimes it is advantageous to index both forms. This is particularly true for NTIS publications and certain Japanese and Indian ones. For details please refer to the appendix. For instance old law Japanese B documents have been indexed in both standards:

```

```

Patent Country

The patent publication country code is part of the patent number in the form of the two letter WIPO code. Additional codes have been defined by Thomson Reuters (Scientific) like RD (Research Disclosure) or TP (International Technology Disclosure) to supplement the WIPO list. A list of valid codes can be found in the appendix. In the corresponding search field the clear text has been additionally indexed. In order to restrict the search to the country of the basic patent only, use the field code /PC.B.

```

Patent Kind Code

The patent kind code is based on the WIPO kind-of-document code and is used to distinguish different types of patent documents published by a single patent issuing authority.

A definition of all the patent kind codes is given in the appendix. However, interpreting patent kind codes can often require extensive knowledge of the patent laws for the country concerned, and how these have changed over time. The Handbook on Industrial Property Information and Documentation, published by the World Intellectual Property Organization (WIPO) may be of assistance. WIPO lists far more status designations for publications at all stages of the patenting process, and for more countries than are included in the PCI database.

Until 199223 only the first character of two-character kind codes was input. Now, both characters are available, where applicable.

As patent kind codes have a country-specific meaning they are usually searched with the preceding country code. Only the complete code has been indexed (e.g. country code plus one or from update 199223 two characters kind code). Therefore to retrieve all European kind A publications requires the use of truncation or masking.

```

Designated States

The designated states are being provided for European (EP) and PCT (WO) documents to indicate which states the applicant has designated for protection of the invention. On PCT applications states are designated as national (the application will proceed via a national patent authority) and/or regional (the application will proceed via a regional authority, i.e. through the European Patent Office or the African Industrial Property Office). For EP documents, the designated states are always indexed as regional. The designated states are searched using the standard the two letter WIPO code. A list of valid codes can be found in the appendix. In the corresponding search field the clear text has been additionally indexed. For PCT (World) documents, national and regional designated states are both searched in the /DS search field. To restrict a search to one or the other, the appropriate qualifier should be used:

```
=> s w: gb/ds
L6      1008754 W: GB/DS
```

or

```
=> s rw: gb/ds
L7      1375492 RW: GB/DS
```

For comprehensive search results by patent country, both the Designated States field and the Patent Country field have to be searched. Information from both fields is searchable with code /PCS.

Designated fields are not included in any default displays for reasons of brevity. This is because applicants are now able to include all possible designated states at the time of application. Only at a later date does the applicant have to indicate which specific countries they wish the application to proceed in.

Designated states are included as part of the PI display but not as part of the simplified PN display which is included in standard displays.

SEL DS selects each country code from the DS field preceded by the respective designation code. SEL PCS selects both the patent countries, and the designated states, the latter without their respective designation codes.

Publication Date

Publication dates have been available for both basics and equivalents since the start of 1974 (197401) to the present. For documents published before 1974, the publication date may not be available. The date can be numerically searched in the search field /PD, the year deduced from it in /PY. The dates and years pertaining to the basic patent have additionally been indexed in /PY.B and /PY.B respectively. The publication dates can be linked with paragraph proximity to other data pertaining to the same publication.

Derwent Update

The updates are consecutively numbered in a year (there are currently 82 per year). In DWPI these numbers have been referred to a 'Derwent Update' or previously 'Derwent Week'. For your convenience /DW and /DW.B are also valid search fields in DPCI.

Publication Language

The language is indicated for all patents. This is particularly useful for countries that accept documents in more than one language such as Canada which accepts applications in both French and English. The language can be searched using either the two-letter ISO standard code or the full name of the language in ISO standard. The language is linked with paragraph proximity (P) to the corresponding patent information.

Publication Type

Documents containing Equivalents, Equivalents-treated-as-Basic and Non-Conventional Equivalents can easily be searched using the Publication Type field. In the patent information field (PI) Basics are identified by an

asterisk "*", Equivalents-Treated-as-Basic are identified with a "B" and Non-Conventional Equivalents are identified with a hash mark "#". For search purposes this translates into "BASIC", "EQUIVALENT", "EQUIVALENTAS-BASIC" or "EQUIVALENTNONCONVENTION" in the Publication Type search field /PT.

Application Data (ADT, AI, APTS)

Content

Application numbers have been recorded since early 1984 (update 198409) for equivalents from the following sources: BE, DE, EP, GB, JP, SU, WO and NL (examined).

In addition, application numbers have been recorded for the same period for chemical equivalents from: FR, NL (unexamined) and ZA.

Since update 199216 however, all application information is recorded.

Where available, application information appears in the detailed display ADT on the same line as the patent numbers to which they belong in the expanded patent information table.

Qualifiers

Search /AC,/AP,/AP.YR,/APTS,/APPS,/AD,/AY,/APT,/APTS

Display AI, ADT, APTS

Select AC, AP, AP.YR, APTS, AD, AY

Notes giving more information on the type of application may also be available. Possible values for these application types include:

Add to	Addition to
Application No	Application Number
CIP of	Continuation-in-part of
Cont of	Continuation of
Derived from	Derived from
Div ex	Division from
Div util	Division from Utility
PCT Application	PCT Application
PCT Nat. Entry	PCT National Phase Entry
Previous Appln	Previous Application
Provisional	Provisional
Related to	Related to
Subst for	Substitution for
Supp Discl	Supplementary disclosure

AI is an additionally provided display format omitting the type information for brevity.

All data pertaining to one application is listed on one line and can be linked by using the paragraph proximity operator (P).

The application information may comprise the following individual data elements:

Application Number

Application numbers can be searched and displayed either in STN standard or Derwent standard format. The standard definitions can be found in the appendix. By and large they follow the following patterns:

STN display format:	CC YYYY-xxxxnnnnnnNd (variable length)
Derwent display format:	YYYCC-xxxxnnnnnnNd (fixed 9, or 12-character length)
Index format:	CCYYYY-xxxxnnnnnnNd (variable length)

YYYY = year
 CC = country code
 d = distinguishing mark
 x = optional alphanumeric character
 n = optional numeric character
 N = mandatory numeric character

When standard display formats are being searched for the numbers are converted matching the index format on the fly.

When application and priority application numbers have both to be searched for, the super-search field /APPS is suitable.

Distinguishing marks

Since some patent countries issue independently running number series and therefore potentially clash - ing document identifiers, some number series receive distinguishing marks in the index in order to avoid said clashes.

US Provisional Applications

All US provisional application numbers are identified with the letter 'P' appended to the end of the serial number, for example, 1998US-80116P. This allows for the differentiation of provisional application numbers from regular application numbers.

Utility Model Applications

Utility Model applications are often having a number series running independently from the patent applications potentially inviting number clashes. In order to avoid these ambiguities all utility model applications apart from those having a positive identification already in the front of the serial, e.g. newer German numbers beginning with a 'zo', are equipped with a 'D' at the end of the number. Due to the coverage of utility models in DWPI this currently mainly applies to Chinese, Korean and Japanese utility model applications.

Application Number Year

The application year found as part of the application number may be different from the application year above. This is particularly true with continuations etc.

where the year in the application date points to the original application year of the parent application while the year in the application number itself points to the current application. Therefore the latter can be searched in /AP.YR

Application Number in Thomson Reuters (Scientific) Format

Format

Application numbers can also be searched and displayed in Thomson Reuters (Scientific) standard. The standard definitions can be found in the appendix. By and large they follow the following pattern:

Thomson Reuters (Scientific) display format
 YYYYCC-xxxxnnnnnnNd
 (mostly fixed 9-character length, zero padded if necessary)

Index format: YYYYCC-xxxxnnnnnnNd

Where: YYYY = four digit year
 CC = two-letter WIPO country code
 D = indicates a distinguishing mark
 N = number
 A = letter
 X = number or letter
 x = optional alphanumeric character
 n = optional numeric character

For German applications published from January 2004 the first two digits of the twelve digit number indicates the IP right (e.g. a patent application or utility model) followed by a 4-digit year and a 6-digit serial number. For the Thomson Scientific standard the year has been removed and a zero inserted. For example 2004DE-102004012346 appears as 2004DE-100012346.

PCT transfers to the Indian Patent Office are identified by a three letter code designating one of the regional offices (DEL = Delhi, KOL = Kolkata, MUM = Mumbai, CHE = Chennai), the letters 'NP' signifying 'National Phase' and a 5-digit serial number, for example, 2004IN-CHENP00010.

Content

Application numbers have been recorded since early 1984 (update 198409) for equivalents from the following sources: BE, DE, EP, GB, JP, SU, WO and NL (examined).

In addition, application numbers have been recorded for the same period for chemical equivalents from: FR, NL (unexamined) and ZA. Since update 199216 however, all application information is recorded.

Gaps in application data coverage have been filled where possible using original data from the following sources:

- German applications, granted patents, and utility models
- European applications and granted patents
- US applications and granted patents
- PCT applications
- Japanese applications

This additional application data is available in a separate search and display field (APTS; Application Number, Thomson Reuters (Scientific)). APTS also contains the application data which has been recorded in DWPI over time and which is available separately within the Application Number (AP) field.

It should be noted however that AP does not contain the additional application data sourced from the above authorities. The AP field therefore remains a reflection of the application data recorded over time within DWPI.

Search

The APTS field contains numbers from the standard Derwent numbers supplemented in particular for older application numbers with numbers from other sources. For your convenience the /APTS search field has been equipped with software to adjust the format of Derwent and STN standard numbers to the Thomson Reuters (Scientific) format.

Filing Details (FDT)

Qualifiers

Search /FDT,/FDT.PC,/FDT.PN,/FDT.PK,/FDT.TP
 Display FDT
 Select FDT,FDT.PC,FDT.PN,FDT.PK

Content

The patent filing details field contains information about patent family members that are not represented in the patent family table. Although the specific data available varies from patent to patent, the types of information that may accompany patent number and kind codes are related patent numbers and filing notes about divisions, continuations and other relationships.

Related Patent Number

The related patent number for the filing details can be searched in the search field /FDT or /FDT.PN. The format follows the same pattern as in /PN.

Content

When an inventor applies for a patent in several countries, the first application (the one with the earliest date), regardless of the country in which it was filed, is the priority application. The date of the first application is referred to as the priority date.

All priorities for each patent since the middle of 1977 (update 197729). Prior to that date, the number of priorities entered was restricted to ten.

In some cases, a patent in one country has broader coverage than a single patent in another country. This situation can result in a patent family having more than one priority application. Multiple priorities can also result when new work is carried out on an invention during the 12 month period between original application filing and priority-based filing abroad. When there are multiple priority applications, the latest priority of the basic patent displays in the Priority Information field, followed by all related priorities. These related priorities may be indexed from the basic patent, equivalent patents in the family, or patents in related families. The latter category includes patents of additions, continuations, continuations-in-part and divisions that are linked to the patent family through their common priorities. This information displays in the table for each patent where applicable.

Search

Use sentence (S) proximity to link data pertaining to one priority application, e.g. priority country and date/year:

```

Display

The complete priority information can be displayed with the format PRAI (PRN being a synonym).

Priority Application Number

The priority application number format follows the patterns already outlined for the application numbers, yet the number of countries covered is far greater than the 40+ for the application numbers. A complete listing is given in the appendix.

Since the coverage is wider more distinguishing marks were required. In particular utility model applications needed additionally to be catered for. Utility Model applications in, for example, Japan, Germany, Spain, Italy, China, and Brazil, are sometimes listed as priority applications when a patent application is filed in an-

other country. All Utility Model applications receive a distinguishing mark in the form of a 'U' appended to the serial number with the exception of the German numbers for which the newer ones have the 'utility mark' already included at the beginning of the serial number.

Note that publications of German Utility Model applications have been covered in DWPI with coverage starting with update 199543. Some French documents came in earlier. Japanese, Korean, Chinese and Taiwanese Utility Models followed more recently (see Asian coverage).

Priority Number in Thomson Reuters (Scientific) Format

Format

Priority Number Thomson Reuters (Scientific) Format

YYYYCC-xxxxxnnnnnnnnND

(padded with leading zeros to nine digits where necessary)

Where: YYYY = four digit year
 CC = two-letter WIPO country code
 D = indicates a distinguishing mark
 N = number
 n = optional number
 A = letter
 a = optional letter
 X = number or letter
 x = optional number or letter

The PRTS format mostly contains nine character serial numbers and always includes the year.

Content

When an inventor applies for a patent in several countries, the first application (the one with the earliest date), regardless of the country in which it was filed, is the priority application. And the date of the first application is referred to as the priority date.

All priorities for each patent have been included in DWPI since the middle of 1977 (update 197729). Prior to that date, the number of priorities entered was restricted to ten.

Gaps in priority data coverage have now been filled where possible using original data from the following sources:

- German applications, granted patents, and utility models
- European applications and granted patents
- US applications and granted patents
- PCT applications
- Japanese applications

This additional priority data is available in a separate search and display field (PRTS; Priority Number, Thomson Reuters (Scientific)). PRTS also contains the priority data which has been recorded in DWPI over time and which is available separately within the Priority Number (PRN) field.

Search

The PRTS field contains numbers from the standard Derwent numbers supplemented in particular for older application numbers with numbers from other sources. For your convenience the /PRTS search field has been equipped with software to adjust the format of Derwent and STN standard numbers to the Thomson Reuters (Scientific) format.

Title Data

Title

Qualifiers

Search /TI, (/BI)
 Display TI
 Select TI
 Sort TI, alphanumeric

Content

Thomson Reuters (Scientific) value-add titles are written to highlight the content and novelty of the invention disclosed in the patent specification. They are not based on the original title or its exact translation.

Search

Combine single words with Boolean and/or Proximity operators (W), (A), (S), (P) or (L). (W) is implied if no operator is input.

Concerning spelling variations, plurals, abbreviations and stopwords the procedures described for the basic index also apply to the title search field (/TI).

Searching the Title field restricts a search further than by searching the entire Basic Index, but relevance may be higher because of the nature of the Thomson Reuters (Scientific) Title. Use of this field may give more

precise results than searching some of the broader Title Terms. When searching for a known original title, users should remember that Thomson Reuters (Scientific) does not input the original title or its exact translation in /TI at the Invention Level, but provides an enhanced more informative title (see individual Patent Publication Section for further information on the availability of original titles).

The title associated with the Basic patent is available at both the Invention and Patent Publication Levels and so has also been indexed twice, once at each level. This allows more selective searching at the Patent Publication Level using the document level qualifier PUBLICATION/DLVL.

The Title field contains single words without punctuation. Compound words containing hyphens, commas, etc., are broken into single words at all non-alphanumeric characters (with the exception of * and @) and punctuation is removed.

Words in the Title field may be searched using Boolean and/or proximity operators. Implied (W) proximity is available and therefore the (W) operator may be omitted in search statements.

In some of the records entered in the database prior to 1971, the titles may be short. Caution is necessary if a search is restricted to /TI for this period.

```

      comprises pigment, dispersant, water, emulsion of self-emulsifiable
      polyurethane and particulate resin dyed with fluorescent dye, having
      specific average particle diameter
```

Special characters

From update 197804 until the end of 1998 the “*” is used with monomers in Thomson Reuters (Scientific) titles to indicate that the monomer is polymerised. Search terms are indexed twice, with and without the “*” mark.

```
=> S ETHYLENE*/TI
L10      12749 ETHYLENE*/TI

=> d ti tt

L10 ANSWER 1 OF 12749 WPIX COPYRIGHT 2011 THOMSON REUTERS on STN
TI High concentration low viscosity polymer poly:ol preparation - by
polymerising ethylene* monomer in polyoxyalkylene poly:ol in presence of
alkyl substd. tert. amine chain transfer agent
TT TT: HIGH CONCENTRATE LOW VISCOSITY POLYMER POLY OL PREPARATION POLYMERISE
POLYETHYLENE MONOMER POLYOXYALKYLENE PRESENCE ALKYL SUBSTITUTE TERT
AMINE CHAIN TRANSFER AGENT
```

From update 197804 until the end of 1998 the @ is used to differentiate between an element or its alloys and compounds of the element, for example:

```
COBALT@ the element or its alloys
COBALT compounds of cobalt
```

The @ symbol is also used to differentiate between the unsubstituted, uncompounded polymer and its copolymers, for example:

```
POLYETHYLENE@ unsubstituted, uncompounded
POLYETHYLENE copolymers
```

In TT, terms with @ have been indexed twice, with and without the @ mark. In the Basic Index, these terms have been indexed without the @.

Select

TI is the default field code for SELECT. If no other field is specified single words from the title are selected automatically.

Title Terms, Additional Words

Qualifiers

Search /TT, (/BI)
 Display TT (custom display only), AW
 Select TT, AW

Content

Title Terms are the preferred forms of words appearing in the Thomson Reuters (Scientific) value-add title. They are generated automatically by a text editing software that converts each title word into a preferred form of the word. For example, the title words PAGE, PAGER, PAGING, etc., are converted into the Title Term "PAGE". A Title Term will only appear once irrespective of the number of title words which may generate this preferred term. (For a listing of title terms see the Title Terms user manual). The following words are ignored when titles are scanned to generate title terms:

AN AND ARE AS AT BE BY FOR FROM HAS IN INTO IS NOT OF ON OR THE THEN WHEN WHERE WHICH

From update 197804 until the end of 1998 additional words have been added to the Title Terms to further enhance the title. Additional words are searchable in /TT as well as in the Title and the Basic Index. These additional words are all included in the Title Terms user guide.

Search

Title Term searching is a very simple and effective way of subject searching. Precision is usually very high, not only because the title terms are controlled forms of the words, but because the specially written Thomson Reuters (Scientific) value-add title is a highly informative, concise summary for rapid scanning. However, inclusion of the much larger number of words in the abstracts, by defaulting to a Basic Index search, will always give higher recall. For best results, all synonyms and every way of expressing the required concept should be considered when formulating the search strategy.

Title Term searching is particularly valuable when searching non-chemical technology where other forms of indexing and classification are not as exhaustive.

Multi-word terms, in use since update 197804, are given in the Title Terms user guide with equal signs linking the individual words, e.g. X=RAY. On STN, replace the "=" with "-" when searching these terms.

From update 197804 until the end of 1998 the "*" is used with monomers in titles to indicate that the monomer is polymerised. Automatic generation of title terms converts these words to title terms with the POLY prefix.

```
=> s x-ray/tt
L11      18994 X-RAY/TT

=> d ti tt

L11 ANSWER 1 OF 18994 WPIX COPYRIGHT 2011 THOMSON REUTERS on STN
TI Method of operating an x-ray diagnostic apparatus with an x-ray beam
   source and an x-ray detector for medical diagnosis
TT TT: METHOD OPERATE X=RAY DIAGNOSE APPARATUS BEAM SOURCE DETECT MEDICAL
```

From update 197804 to the end of 1998 @ is used to differentiate between an element or its alloys and compounds of the element, for example:

COBALT@ the element or its alloys
 COBALT compounds of cobalt

The @ symbol is also used to differentiate between the unsubstituted, uncompounded polymer and its copolymers, for example:

POLYETHYLENE@ unsubstituted, uncompounded
 POLYETHYLENE copolymers

In TT, terms with @ have been indexed twice, with and without the @ mark. In the Basic Index, these terms have been indexed without the @.

```

=> S COBALT@/TT

Display

Title Terms are arranged in the same order in which the original words occur in the title. Therefore, words covering the same concepts and related in meaning are grouped together. As a result use of the (nW) operator may be useful.

Title Terms are not displayed in predefined formats, including ALL, because they are redundant with the title in TI. However, they may be displayed with the custom display format TT or in the predefined display format MAX.

Additional words are displayed in TT preceded by 'AW'. They are displayable separately with the field code AW.

```

L14 ANSWER 1 OF 101 WPIX COPYRIGHT 2011      THOMSON REUTERS on STN

Content

The majority of records in DWPI (85%) have an abstract for the basic patent. Novelty and Technology Focus fields became available from update 1999o8 onwards. At this time the Basic Abstract was renamed the Alerting Abstract.

Basic abstracts for Austria, Brazil, and Denmark are only available for chemical Basics. Abstracts are not included for records where the Basic patent is from Czechoslovakia, Finland, Italy, Luxembourg, and Norway. In all these

cases however, an abstract is added to the record when an equivalent from a country with a guaranteed basic abstract is added to the family.

From 1984 to 1997 abstracts were also prepared for many equivalent members of the patent family. These are displayable with the individual patent publication section. However all patent publication abstracts have been indexed within /AB and can be displayed with the ABEQ, ABS and MAX display formats.

Old Style Basic Abstracts

Pre-1999 records may contain an abstract section called the First Section which was based on the claims together with a Use, Use/Advantage or Advantage section.

New Style Alerting Abstracts

In 1999 important changes were made to the structure and content of abstracts. As well as containing improved technical content, the abstracts also include several sub-headings to make the description of the invention easier to read:

SUBHEADING	DESCRIPTION
Novelty	Outlines the novelty of the invention.
Detailed Description	Optional paragraph included when it is not possible to summarise the main claims of the invention within the novelty field.
Activity	Used to describe the biological activity of chemical or biological entities.
Mechanism of Action	Covers the biological mechanism of action for chemical or biological entities (where given).
Use	This paragraph is always present, and covers all the uses (applications) of the invention in terms of its different technology areas. If there are no disclosed uses, this is stated.
Advantage	Covers the advantages of the invention as described by the author.
Description of Drawing(s)	Explanation of technical drawings included in the record.

Search

Apart from the basic index all words are searchable in /AB. This comprises ALL abstracts, including Original and Equivalent abstracts.

Implied word proximity, simultaneous left and right truncation, SET PLUrals, SET ABBreviations, SET SPELLing all apply.

 NOVELTY - Modifying (M1) a substrate surface involves contacting at least a portion of the substrate with an alkaline solution under oxidative conditions. The solution comprises a surface-modifying agent containing polymer having dihydroxy benzene derivative.
 DETAILED DESCRIPTION - Modifying (M1) a substrate surface involves contacting at least a portion of the substrate with an alkaline solution under oxidative conditions. The solution comprises a surface-modifying agent containing polymer having dihydroxy benzene derivative of formula (I).
 R1-R5=thiol, primary amine, secondary amine, nitrile, aldehyde, imidazole, azide, halide, polyhexamethylene dithiocarbonate, hydrogen, hydroxyl, carboxylic acid, aldehyde, carboxylic ester or carboxamide; and
 x=0-10;
 y=0-10; and
 x+y=at least 2 or 3.
 Provided that at least one of R1-R5 is not a hydrogen atom; and x or y is at least 1. R1 and R4 form a double bond when eliminated.
 INDEPENDENT CLAIMS are included for the following:
 (1) modifying (M2) the substrate surface to provide a desired functionality involving the method (M1) and contacting the surface-modified substrate with a reactive moiety, where the reactive moiety reacts with and is bound to the modified surface;
 (2) reducing amounts of metal in a fluid involving the method (M2); and positioning the surface-modified substrate with a reactive moiety bound to the modified surface in a fluid with metal, where the modified substrate binds to at least a portion of the metal;
 (3) forming biofouling-resistant modified substrate involving the method (M1); and contacting at least a portion of the surface-modified substrate with a biofouling-resistant reactive moiety; and
 (4) a kit for modifying a substrate surface comprising the surface-modifying agent (I); and instructions for use.
 USE - For modifying a substrate surface useful to get a desired functionality, in coating medical devices, in biofouling-resistance, for reducing amounts of metal in a fluid (claimed), for surface modifications of drug delivery carriers and tissue engineering scaffolds, in biosensors, industrial and consumer coatings, photolithography, semiconductors, surface catalysts, next generation electronic displays, electrodeless metallization, self-assembled monolayers, polymeric grafting, and protein labeling.

ADVANTAGE - The surface-modifying agent acts as a powerful building block for thin polymer film deposition on virtually any bulk material surface where the deposited films are easily adaptable for a remarkable variety of functional uses. The process provides surface-independent, surface-modification method where substrates are modified to display at least one reactive moiety on the substrate surface. The surface-independent nature of the method provides applications in diverse fields such as biocompatible coatings of medical devices, surface modifications of drug delivery carriers and tissue engineering scaffolds, biosensors, industrial and consumer coatings, semiconductors, surface catalysts and next generation electronic displays. The surface-modifying agent forms a polymeric coat on the substrate surface exhibiting desired functionality to the modified surface, reduces the amounts of metal in a fluid, and exhibit biofouling-resistant. The method enhances coatings on artificially or naturally damaged/altered substrates. Linking of His-tagged proteins on surface-modifying agent treated substrates is easy, which is useful for protein immobilization and can be a convenient way to control the orientation of immobilized proteins on surfaces, diagnostic and/or purification purposes.

Technology Focus

Content

This field, introduced from update 199908 onwards, is designed to enable end-users scientists and engineers, in various sectors, to quickly identify if a patent document is of real interest to them.

Separate headed paragraphs describe the invention from different technological viewpoints – immediately bringing home the importance of the patent to a variety of disciplines.

The Technology Focus is used to summarise the dependent claims, i.e. the preferred options for making practical use of the invention, and claims related 'preferred options' taken from the 'disclosure' of the patent. Information from outside the core technology can also be covered, e.g. preferred polymeric materials used in the manufacture of an engineering invention. The text is written using separate titled paragraphs, which are used to summarise the practical content of the invention from different technological viewpoints. The paragraph headings are described below. All the paragraph headings are fully searchable as free text within the Technology Focus field.

Heading	Defintion
Agriculture	Covers pesticides, herbicides, fungicides, fertilisers, etc, but not their preparation. See Organic Chemistry.
Biology	Covers naturally occurring biological materials (i.e. not engineered), immunoassays, etc.
Biotechnology	Covers genetic engineering (recombinant DNA technology), etc.
Ceramics and Glass	Covers glass, refractories, ceramics, cement, etc.
Chemical Engineering	Covers large scale, industrial processing of chemicals.
Computing and Control	Covers automotive, environmental, manufacturing processes, etc.
Electrical Power and Energy	Covers power generation, nuclear power, radioactivity.
Electronics	Covers electronic circuits and devices.
Environment	Covers pollution control, water treatment, sewage treatment, etc.
Food	Covers human foodstuffs, brewing, animal feed, etc.
Imaging and Communication	Covers imaging technologies, inks, printing, electrophotography, recording media, broadcasting and telecommunications.
Industrial Standards	Used when comparison to industrial standards are made.
Inorganic Chemistry	Covers all inorganic materials, except Ceramics and Glass.
Instrumentation and Testing	Covers chemical analysis, testing, medical equipment.
Mechanical Engineering	Covers polymer processing machinery, mechanical equipment, etc.
Metallurgy	Covers metal treatment/production/refining/working/finishing, alloys, solders, etc.
Organic Chemistry	Covers the preparation of all organic chemicals, including pharmaceuticals and agrochemicals, but not polymers - see Polymers.
Pharmaceuticals	Covers pharmaceutically active compounds and compositions, including veterinary drugs, but not their preparation - see Organic Chemistry.
Polymers	Covers all polymer types, preparation of polymers, etc.
Textiles and Paper	Covers paper/cardboard, natural/synthetic textiles, and their processing.

Abstract Extension

Qualifiers

Search /ABEX, /ABEX.WD, /ABEX.ADM, /ABEX.SC,
/ABEX.EX, /ABEX.DEF
Display ABEX
Select ABEX

Content

The Extension Abstract is an optional field introduced from update 199908 onwards, only being present when there is sufficient detail in the original patent document, and it should be read in combination with the Alert Abstract and Technology Focus to make complete sense. Like the Alert and Technology Focus Abstracts, the Extension Abstract has separate titled paragraphs, presenting the content of the patent document in a more easily understood form.

Display of the ABEX field (in file WPIX only) is restricted to subscribers with the appropriate level of subscription. However, the Extension Abstract text does form part of the Basic Index and so is available for all users to search.

When displayed in combination with the Alert and Technology Focus abstracts, the Extension Abstract is ideal for the end-user scientist or engineer who needs a detailed summary of a patent, free from legalistic jargon. This helps the end-user to bridge the gap between the concise Alert Abstract summary, and the often lengthy, difficult-to-read, full text patent document.

The Extension Abstract field also offers additional free text searching possibilities for experienced online searchers. When taken together the Alert, Technology Focus, and Extension Abstract fields represent the current online implementation of the in-depth Documentation Abstracts.

Documentation Abstracts for the period 1995-1999 are available in the ABDT field. The Extension Abstract contains a series of titled paragraphs, as described below, and is only used for inventions classified in the Chemical Patents Index (CPI).

Heading	Definition
Wider Disclosure	Used when the scope and/or novelty of the invention, as defined in the body of the specification, is broader than that of the main independent claim(s). The paragraph will contain those novel features and/or applications which fall outside the definition of the invention, as described in the legal claims. The wider disclosure paragraph is not used for patents which are related to other patents or applications, which have already been published, e.g. United States 'continuation-in-part' documents.
Administration	Used to cover details of dosages and methods of administration for pharmaceutical/veterinary patents, or rates of application and application methods in agrochemical patents.
Specific 'Substances'	This is used for specific substances which relate to, or exemplify, the novel features of the invention, and not to cover all specific substances. The information is grouped together under one or more headings selected from a controlled list, depending on the 'substances' being defined, e.g. specific compounds, specific sequences, specific cells, specific materials, etc.
Example	A summary of an example which provides data in support of the advantages of the claimed invention, or details about how the invention is carried out in practice. The paragraph is not included if it does not add any information to that already reported in the Technology Focus Abstract.
Definitions	This is normally immediately followed by the phrase 'preferred definitions:'. The paragraph is used to detail the preferred options for Markush chemical formulae defined in the Detailed Description paragraph of the Alert Abstract.

As well as being searchable as part of the /ABEX field each constituent sub-section of the Extension Abstract is also specifically searchable.

Select ABDT

Content

The Documentation Abstract is an optional field available for documents - most CPI records - from 1995 to 1999 and provides a more in-depth analysis of the invention than the Basic Abstract. The Documentation Abstract therefore bridges the gap between the concise Basic Abstract summary, and the often lengthy, difficult-to-read, full text patent document

Display of the ABDT field is restricted to subscribers with the appropriate level of subscription (WPIX only). However the Documentation Abstract text does form part of the Basic Index and so is available for all users to search offering additional free text searching possibilities.

From update 1999o8 the Documentation Abstract was replaced by the Extension Abstract.

The Documentation Abstract may contain a series of titled paragraphs, as described overleaf, and was only used for inventions classified in the Chemical Patents Index (CPI).

Heading	Definition
Activity	Used to describe the biological activity of chemical or biological entities.
Mechanism of Action	Covers the biological mechanism of action for chemical or biological entities (where given).
Administration	Used to cover details of dosages and methods of administration for pharmaceutical/veterinary patents, or rates of application and application methods in agrochemical patents.
Advantage	Covers the advantages of the invention as described by the author.
Biology	Contains biological activity and/or biological data relating to the invention.
Claimed	Contains details of the invention disclosed within the Independent Claims. May comprise a number of "Claimed" headings.
Definitions	This paragraph is used to detail the preferred options for Markush chemical formulae defined in the Detailed Description paragraph of the Basic Abstract.
Description	Included when it was not possible to summarise the main claims elsewhere.
Dosage	Covers pharmaceutical dosages and methods of administration.
Drawing Description	Explanation of technical drawings included in the record.
Embodiment	A more detailed description using information from the disclosure that is not in the claims.
Example	The selected example illustrates the novelty/advantages of the invention.
First Section	Covers all independent claims (except for those dealing with uses and preparations which are covered in their own sections). The novel features of the invention will also be highlighted.
General	Contains information not relating to standard Documentation Abstract sub-sections.
Inorganic Chemistry	Covers inorganic materials.
Starting Materials	When starting materials or their preparation have been claimed or described as new, their preparation is detailed.
More Specifically	Used to narrow chemical Markush definitions that are very broad or vague. This information is available in the claims or disclosure.
Novelty	Outlines the novelty of the invention.
Organic Chemistry	Covers organic materials.
Preferred	Contains a detailed description from the dependent claims. May be split into a number of preferred headings.
Preparation	If the invention contains new compounds, this section is used to describe their preparation.
Specific Substances	When a patent claims a group of compounds covered by a Markush structure, this section is used to give specific examples from this group (claimed examples taking priority).
Technology Focus	Used to summarise the dependent claims, i.e. the preferred options for making practical use of the invention, and claims related 'preferred options' taken from the 'disclosure' of the patent.
Use/Advantage	Some records may contain a combined use/advantage section outlining both the use of the invention and the advantages of the invention as described by the author.
Use	Covers the use of the invention.
Wider Disclosure	Used when the scope and/or novelty of the invention, as defined in the body of the specification, is broader than that of the main independent claim(s). The paragraph will contain those novel features and/or applications which fall outside the definition of the invention, as described in the legal claims.

As well as being searchable as part of the /ABDT field each constituent sub-section of the Documentation Abstract is also specifically searchable.

Graphic Images

Graphic Information

Qualifiers

Display GI, GI.M

Content

Images, technical drawings and chemical structures, became available early in 1994 for display and offline print in the WPINDEX/WPIDS/WPIX files. Currently there are over 10 million available with approximately 10,000 added with each update from the electrical, general and mechanical and chemicals sections.

There can be one or more images available per record, which is displayed in the Graphic Information (GINF) field. Images associated with individual publications can be displayed with GI.M.

Records that contain an image have a "GI" entry in the Field Availability (/FA or /FA.M) field.

Download of the image is triggered by the display field code GI or GI.M. The images are sent as binary graphics data via the Kermit protocol. To view the images your PC-software must be able to interpret TIFF images using the CCITT T6 group 4 format that is also used for facsimile coding. STN's multifunctional software for online searching, STN Express, is equipped with this capability. STN Express and STN on the Web automatically display any images within the record if an image format is requested.

Images are also available in the following predefined formats: ALLG, IALLG, BRIEFG, IBRIEFG, MAXG, IMAXG, FULLG, IFULLG, MEMBG and MEMBFG.

Indexing

Patent Office Classifications

For indexing assigned by patent offices like International Patent Classifications, European Patent Classifications, US National Classifications and Japanese Patent Classifications a uniform approach is being taken at STN as far as possible. This ensures smooth operation in multi-file environments and keeps search complexity for the users at a minimum.

International Patent Classification (IPC)

While the general approach concerning the IPC taken at STN had been communicated and documented previously, there are some file-specific issues concerning DPWI which shall be relayed here along a brief general outline. More detailed general documentation on the IPC classifications at STN is available from:

www.stn-international.de/stndatabases/details/ipc_reform.html

Content

The International Patent Classification (IPC) system is a patent classification scheme, administered by the World Property Intellectual Organisation (WIPO) that has varied in scope and application through a number of editions.

Edition	Scope
Edition	Scope
1st Edition	1 September 1968 - 30 June 1974
2nd Edition	1 July 1974 - 31 December 1979
3rd Edition	1 January 1980 - 31 December 1984
4th Edition	1 January 1985 - 31 December 1989
5th Edition	1 January 1990 - 31 December 1994
6th Edition	1 January 1995 - 31 December 1999
7th Edition	1 January 2000 - 31 December 2005
8th Edition	1 January 2006 -

The introduction of the IPC in 1968 saw the availability for the first time of a single classification system for patent literature as before then searches had to be conducted across various national patent classification systems, each with differing codes, structures and indexing philosophies.

Since 1968 the IPC has undergone regular revisions to ensure that the indexing system has kept pace with changing technology, with new codes added to reflect technological advances and existing codes sub-divided or discontinued to reflect changes in patenting activity.

Prior to the introduction of the 8th Edition of the IPC, the IPC Reform, revisions of the IPC only became effective from the date of introduction forwards. This limitation of the IPC was compounded by the fact that different patent authorities may have introduced new codes at varying times. This meant that for a full retrospective search it was necessary to use IPCs from all previous editions.

The 8th Edition of the IPC however introduced a radical reform whereby all the documents held within the European Patent Office's Master Classification Database, MCD, are subject to ongoing reclassification with each future revision of IPC codes. It is therefore more appropriate to call the latest edition of the IPC the IPC Reform rather than the 8th Edition.

This reclassification aspect of the IPC Reform should eventually ensure that only one version of the IPC, the current version of the IPC Reform, is required for complete retrieval of all relevant documents, thereby removing one of the major limitations of Editions 1-7 of the IPC.

Thomson Reuters (Scientific) is applying all IPC Reform reclassifications to IPCs as they become available. The Current IPCs for the patent family will be available at the Invention Level. The current IPCs for each family member will also be available at the Patent Publication Level together with the Original (Initial) IPCs for that document.

The set of IPCs on the invention level of a DWPI document is being collated and deduplicated into a representative set of IPCs for the invention. For this purpose the IPC Reform and IPC version 1-7 data are kept separate and not deduplicated against each other. Certain attribute information available for IPC Reform codes was deemed insignificant on this level of detail in order to avoid having large numbers of codes with little variations in the attributes attached to it.

The IPC version 1-7 codes are being slowly purged from the set of Current IPCs associated with the invention as reclassification progresses. Since the concept of 'main' IPC is alien to IPC Reform data, STN provides a new

'lead' IPC for the entire invention regardless whether there is IPC Reform or IPC version 1-7 data available for the invention. The IPC.F select and sort code and the algorithm it is based on has been described previously, see

www.stn-international.de/archive/stnews/2007/news0207.pdf.

The IPC Reform

Two levels of IPC, Core and Advanced, are available for use by the patent offices. Advanced IPC codes are generally applied by the larger patent offices with sufficient resources to apply to an advanced level. Core IPC codes are applied by the remaining smaller offices.

The European, United States, Japanese, German and UK Patent Offices have all indicated that they intend to use the Advanced level. As the EPO maintains PCT minimum documentation within the MCD this collection will be searchable using Advanced level IPCs.

A list of the current use of IPC Reform by the patent offices can be found at

www.wipo.int/classifications/ipc/en/reform/table_use_core_adv.pdf

Following the initial release of the reclassified MCD in early 2006, quarterly revisions to the Advanced Level IPCs have been performed, but the frequency will be lowered for 2009. A three year revision cycle applies for the Core Level IPCs. The 9th edition is scheduled for January 2009.

News about new versions can be found at

www.wipo.int/classifications/ipc/en/news.html

In addition the complete patent document is now classified, with "Inventive" classes applied to inventive features described within the claims and "Additional/Non-Inventive" classes applied to features described within the body of the patent specification.

The general format of an IPC is ANNA-NNNN/NNnnnn and it is structured in the order left to right:

Component	Definition
A	Section
NN	Class
A	Sub-class
NNNN	Main Group
NNnnnn	Sub-group

Attributes are associated with each IPC code to provide further details on the application of the IPC:

Attribute	Code	Definition
Version Indicator	YYYYMMDD	IPC version date
Class Level	A C S	Advanced level Core level Subclass level
Position	F L	First invention information Later invention information
Scope	I N	Inventive Non-Inventive/Additional
Action Date	YYYYMMDD	Date the IPC code was /applied
Level	B R V D	Original Classification Reclassification Modified/Corrected Deleted
Applied	H M G	Intellectual Classification Machine Propagation across a family Automatic Generation
Office	CC	The country or office code that delivered the classification

Some attributes may not be populated by certain patent offices.

Note: when searching attributes the level attribute “B” has been indexed as “O” and not “B” to avoid any confusion with “Basic”.

Sample IPC Reform Codes of interest can be determined by consulting the World WIPO website at:

www.wipo.int/classifications/ipc/en/
www.wipo.int/classifications/ipc/ipc8/

IPCs of interest can also be determined by retrieving a few relevant records using a keyword search and then checking the IPCs by viewing the records in a free-of-charge format.

Editions 1-7 of the IPC

The general format of an IPC was ANNA-NNN/NNnnn and was structured in the order left to right:

Component	Definition
A	Section
NN	Class

NNN	Main Group
NNnnn	Sub-group

Main, Secondary, Additional (Supplementary) and Index (Complementary) IPCs were assigned by the patent offices.

These classifications are now deprecated and only available in the current IPC search fields when the corresponding documents have not yet been reclassified. Yet they are available for many documents still when they were attached to the original publications (see chapter on Initial IPCs).

Search

The IPC indexing at STN follows a uniform approach as far as possible across all applicable patent data bases. STN provides an IPC index field (/IPC) containing all IPC codes, any version and at any level conveniently normalized to a uniform format. For most searches this will be sufficient to meet the requirements, yet for the discerning searcher a more sophisticated set of tools is available as well.

Thomson Reuters (Scientific) is applying all the IPC Reform reclassifications to IPCs as they become available. This means that the Current IPCs for the patent family will be available at the Invention Level within Derwent World Patents Index facilitating improved

retrieval of relevant documents. On the availability of Current IPCs for each constituent family member and on the availability of Original (Initial) IPCs as published on the patent document see individual patent publication section.

However due to variations in the publication of the initial IPC Reform reclassifications by the various worldwide patent offices and potential differences in the patent families held within Derwent World Patents Index and the European Patent Office’s MDC, it is possible that the Current IPCs for a family at the Invention Level in Derwent World Patents Index may comprise a combination of IPCs from Editions 1-7 and reclassified IPCs from the IPC Reform.

For example if we consider a patent family comprising patents A, B and C in Derwent World Patents Index, this same family in the MDC may only comprise patents A and B due to the European Patent Office’s simple patent family rules. If patents A and B have been reclassified as part of the IPC Reform then these revised codes will be present in Derwent World Patents Index. However if patent C has not been reclassified then the Current IPCs for patent C remain the IPCs issued under the IPC edition in force when patent C was published. Thus the Current IPCs for the family in Derwent World Patents Index at the Invention Level would comprise the IPC Reform codes for patents A and B and IPC1-7 codes for patent C. The Original (Initial) IPCs as issued under Editions 1-7 of the IPC for patents A and B would be searchable at the Patent Publication Level.

Another scenario is where patents A, B and C were issued with IPC Reform codes. Patents A and B were subsequently reclassified but patent C was not. The Invention Level would consequently comprise the IPC Reform codes with an attribute level of R indicating “reclassification” (from patents A and B) and the IPC Reform codes with an attribute level of B indicating “original/initial classification” (from patent C).

The advent of continual reclassification as part of the IPC Reform means that users who maintain SDIs need to consider the impact of potentially frequent changes to the IPC classifications within their area of technological interest to avoid their SDIs becoming redundant.

In addition the availability of attribute information such as “Inventive” and “Non-Inventive” as part of the IPC Reform enables users to focus on inventions with key features described in the claims or elsewhere within the document if required.

When searching the IPC Reform it should also be remembered that some patent offices only classify to the Core Level (or even subclass level) and not down to the Advanced level. On the other hand documents classified at the Advanced level will also receive the closest corresponding Core level by auto-generation but this

will only occur as part of one of the regular MCD reclassification releases. IPC classes forming the Core level are also not simply a truncation of classes forming the Advanced level; rather they are a selected sub-set.

This could have serious implications for searches. For example a search in the Core level give more complete results but would miss recently issued documents classified at the Advanced level but which have not passed through an MCD reclassification cycle and so are still only classified at the Advanced level, whereas a search in the Advanced level, although more precise, would only retrieve results from those patent offices applying to the Advanced level.

In order to help alleviate this problem Thomson Reuters (Scientific) auto-generates the closest Core level IPC for documents which have been classified to the Advanced level but which do not yet carry the corresponding Core level IPC as they have not been subject to an MCD reclassification cycle. The Core level IPC will be auto-generated using the core predecessor in the IPCR authority file provided by WIPO. To help identify these auto-generated Core level IPCs Thomson Reuters (Scientific) will give them an office attribute (CC) of "98". User will still need to use both the Core and Advanced level codes to ensure comprehensive world-wide of relevant subject matter due to the fact that some patent offices will only be applying the Core or even Subclass level.

It should be noted that Thomson Reuters (Scientific) will only generate a Core level IPC if this Core level code differs from the corresponding Advanced level code i.e. where the Core and Advanced codes are not the same.

Depending on user requirements a potential search strategy could be:

1. Search at Advanced level to retrieve documents (i) within the scope of the PCT minimum documentation plus (ii) documents classified by patent offices applying the Advanced level plus (iii) the converted MCD back file
2. Search the closest Core/Subclass level to retrieve documents classified by patent offices applying the Core/Subclass level only
3. Deduplicate results obtained in (2) from those already obtained in (1).

Thomson Reuters (Scientific)-assigned IPC Codes

If there aren't any IPC codes given by the patent office, or if an invalid IPC is printed, Thomson Reuters (Scientific) will try to assign its own IPC codes to the subclass level.

Historically Thomson Reuters (Scientific)-assigned IPCs were entered with a 000/01 as the main group and subgroup number, e.g. A23L-000/01. Occasionally, more specific symbols with digits different from 0 may have been assigned.

IPC codes assigned by Thomson Reuters (Scientific) from January 2006 are given an office attribute (CC) of "99" and are assigned to the subclass level.

Historical Coverage, Editions 1-7

IPCs became available for most basic documents (new inventions) from 1970. They were not available for unexamined Japanese applications published before April 1975 or for Canadian documents published before 1974 (update 197403).

From early 1974 (updates 197403) IPCs from equivalents that differed at the main group level or above from those of the basic were added.

Until 1980 a maximum of 6 IPCs were recorded from a single document. From 1980 (update 198049) this was increased to a maximum of 12. If IPCs only differed at the subgroup level, only one was entered.

From 1992 (update 199216) the full format of IPCs down to the third or fourth digit of the subgroup were entered and since that point these finer divisions became searchable.

Some patent offices only assigned IPCs to the subclass level. Historically these were entered in DWPI with 000/00 as the main group and subgroup number, e.g. A23J-000/00. These entries are now being corrected to remove the 000/00.

In addition there were often inconsistencies at the subgroup level resulting from variations in practice between different patent offices. Consequently more complete, but less specific, retrieval could be obtained by searching at the subclass or main group levels.

With the introduction of the 4th Edition of the IPC at the beginning of 1985, indexing (as opposed to official classification) terms were also assigned by patent offices. These were input in DWPI since update 199216 using a hyphen (-) between the main group and subgroup instead of a slash (/) as in true IPCs.

For IPC subgroups published with more than two digits after the second hyphen, only the first two digits were input in DWPI before update 199216. However, it is only necessary to truncate for IPCs with 3- or 4-digit subgroups as for example A23J-001-02 does not have any finer divisions beyond "/02" so a direct search of this 2-digit subgroup IPC would retrieve all examples.

IPC Reform

Reclassifications are assigned in as and when they become available. At the Invention Level within WPI all Current IPC Reform codes for the basic document are available.

Current IPC Reform codes from equivalent documents are included at the Invention Level if they are considered unique when compared to other IPC Reform codes for the family based on a combination of the IPC code and the attributes:

Classlevel (Advanced | Core | Subclass), Position (First | Later), Scope (Inventive | Non-Inventive) and Level (Original | Reclassified | Modified | Deleted).

For example an IPC of

F24F-1/00 Class level = A, Position = F, Scope = I, Applied = M, Level = R, Office = JP

is considered different from

F24F-1/00 Class level = C, Position = F, Scope = I, Applied = G, Level = R, Office = CN

as in the first example the IPC was applied at the Advanced level compared to the Core level in the second example (the differences in issuing office, JP and CN, and application, M and G are ignored), but the same as

F24F-1/00 Class level = A, Position = F, Scope = I, Applied = M, Level = R, Office = DE

as the difference in issuing office, JP and DE is ignored. For this purpose missing attributes are considered significant.

For example an IPC of

F24F-1/00 Class level = A, Position = F, Scope = I, Applied = M, Level = R, Office = JP

is considered different from

F24F-1/00 Class level = A, Scope = I, Applied = M, Level = R, Office = EP

as the position attribute has not always been populated by the European Patent Office. Several attributes have been omitted from the Current IPCs at the Invention Level as they are meaningless in the context of the compilation rules for Current IPCs from equivalent documents; these are Action Date, Applied, and Office. However all IPCs and their associated attributes are available at the Patent Publication Level. In addition Original (Initial) IPCs as published on the patent document are available at the Patent Publication Level (subject to the historical availability of IPCs as outlined above).

Truncation

Each IPC code is indexed at the subgroup, main group and subclass levels to avoid the need to use extensive truncation when very generic searches are required. For example, the single IPC code A23J-001/02, consists of the following parts:

		Directly Indexed	Search Format
A	Main Section	n	-
A23	Class Level	n	-
A23J	Subclass Level	y	A23J
A23J-001	Main Group Level	y	A23J-001
A23J-001/02	Subgroup Level	y	A23J-001/02

On STN, there are several fields available for searching Current IPCs at the Invention Level depending on whether the user wishes to search for an Edition 1-7 IPC or an IPC Reform IPC or both at the same time.

IPC index

/IPC is an index containing a normalized version of all IPCs at both the Invention (Current IPCs) and Patent Publication Levels (both Current and Original/Initial IPCs). /IPC can be searched using either a 3 or 4-digit Main Group.

STN Search Qualifier	Content
/IPC	IPCs 1-7 and IPC Reform, Invention and Patent Publication Levels, Current and Original/Initial

An IPC thesaurus is attached to the /IPC field and allows the definitions of IPC codes to be viewed in their respective hierarchy. In addition it also allows searching across a range of IPC codes.

IPC Reform Search Fields

STN Search Qualifier	Content
/IPC.REF	IPC Reform codes

Thomson Reuters (Scientific) supplies the Current IPC Reform codes for the family at the Invention Level. These IPCs may comprise a combination of both Original IPC Reform codes (level attribute = B) and reclassified IPC Reform codes (level attribute = R) as a result of the scenario outlined above where the patent families within WPI and the MDC differ. These Current IPCs are subdivided at the Invention Level into two separate display fields according to the level attribute, IPCI (attribute = B, Original Classification) and IPCR (attribute = R, Reclassification).

Editions 1-7 Search Fields Qualifiers

STN Search Qualifier	Content

/ICA	IPC, Additional (Supplementary)
/ICI	IPC, Index (Complementary)
/MGR	IPC Main Group Range Searchable
/SGR	IPC Subgroup Range Searchable

International Patent Classification, Current, Main and Secondary

Qualifiers

Search /IC
Display IC
Select IC, SCG, SCL

Format

S ANNA/IC	Sub class
S ANNA-NNN/IC	Group
S ANNA-NNN-NNnnn/IC	Sub Group

Where: A = letter
N = number

Content

If available /IC contains the Current Main and Secondary IPCs for the family.

Search

Searching an IPC with the /IC qualifier retrieves patent families with that IPC as a Current IPC (versions 1-7), whether it was assigned as a Main IPC or a Secondary IPC. The Main and Secondary IPCs can be searched on subclass, main group and subgroup level with the specific search formats listed above in either Derwent or STN format.

```
=> S D01B/IC
L35      723 D01B/IC
```

Please note: searching 'Do1B' is equivalent to searching 'Do1B?'. However, search format ANNA reduces search time and avoids truncation limits.

```

When searching on class level, e.g. A01, use the truncation symbol '!' instead of '?'. ANN! uses the up-posted index entries in format ANNA instead of all entries, this reduces search time.

Select

SELECT IC leads to a list of the complete IPCs, SELECT SCG (Subclass with Main Group of IC) leads to a list in format ANNANNN (ANNA-NNN), and SELECT SCL (Subclass of IC) leads to a list in format ANNA.

SELECT uses automatically the formats defined by SET PATENT.

```

IPC, Main

Qualifiers

Search /ICM, /IC, /IPC

Display ICM, IC

Select ICM, SCGM, SCLM, IPC, IPC.F

Sort ICM, alphanumeric

Content

If available /ICM contains the Current Main IPCs for the family.

Search

The same search formats as described for field /IC are valid.

The Main IPC of the Basic Patent can be conveniently searched using /ICM in combination with the Patent Type /PT

```
=> ANNA/ICM(L) BASIC/PT(L) PUBLICATION/DLVL
```

In addition the IPC Keyword field /IPC.KW will be indexed with ICM and MAIN as well as BASIC if applicable.

```
=> ANNA/ICM(S) BASIC/IPC.KW
```

The concept of a Main IPC was discontinued as part of the IPC Reform. Therefore searches in /ICM are being regarded as deprecated.

Select

The dependence of the formats of the Main IPC upon the SELECT codes is as described for IC:

Code Format

ICM	Main IPC (ANNANNN-NNnnnn)
SCGM	Subclass with Main Group of Main IPC (ANNANNN)
SCLM	Subclass of Main IPC (ANNA)

The formats listed are STN standard (the default). Use SET PATENT DERWENT to request IPCs in Derwent format. IPC.F selects one 'lead' IPC from either IPC1-7 ICM codes or IPC Reform (preferably with a position attribute of "First") from the basic patent.

Sort

Search results can be sorted by the first Main IPC displayed in ICM.

IPC, Secondary**Qualifiers**

Search	/ICS, /IC, /IPC
Display	ICS, IC
Select	ICS, SCGS, SCLS, IPC

Content

If available /ICS contains the Current Secondary IPCs for the family.

Search

The same search formats as described for field /IC are valid.
In addition the IPC Keyword field /IPC.KW contains the terms ICS and SECONDARY.

Select

The dependence of the formats of the Secondary IPC upon the SELECT codes is as described for IC:

Code Format

ICS	Secondary IPC (ANNANNN-NNnnnn)
SCGS	Subclass with Secondary Group of Secondary IPC (ANNANNN)
SCLS	Subclass of Secondary IPC (ANNA)

The formats listed are STN standard (the default). Use SET PATENT DERWENT to request IPCs in Derwent format.

IPC, Additional

Qualifiers

Search /ICA, /IPC
 Display ICA
 Select ICA, SCGA, SCLA, IPC

Content

If available /ICA contains the Current Additional IPCs for the family. These not-obligatory IPCs are used to describe facts not contained in the claims but in other parts of the patent document.

Search

The same search formats as described for field /IC are valid.
 In addition the IPC Keyword field /IPC.KW contains the terms ICA and ADDITIONAL.

Select

The dependence of the formats of the Additional IPC upon the SELECT codes is as described for the Main IPC:

Code	Format
ICA	Additional IPC (ANNANNN-NNnnnn)
SCGA	Subclass with Additional Group of Additional IPC (ANNANNN)
SCLA	Subclass of Additional IPC (ANNA)

The formats listed are STN standard (the default). Use SET PATENT DERWENT to request IPCs in Derwent format.

IPC, Index (Complementary)

Qualifiers

Search /ICI, /IPC
 Display ICI
 Select ICI, IPC

Content and Search

If available /ICI contains the Current linked and non-linked IPC codes for the family which describe aspects of the claims as well as aspects of the remaining patent document.

In addition the IPC Keyword field /IPC.KW contains the terms ICI and INDEX.

The IPC codes which include a colon instead of a hyphen between the main group and the subgroup are associated with various main groups of IPC. These associated codes are indexed using the (S) proximity operator. Multiple sets of associated codes are separated by semicolon in the display.

For Index IPCs, as for all other IPCs, search formats on subclass, main group and subgroup level are available:

Derwent format	STN format
ANNA-NNN/NNnnnn	ANNANNN-NNnnnn
ANNA-NNN:NNnnnn	ANNANNN:NNnnnn
ANNA-NNN	ANNANNN
ANNA	ANNA

Select

SELECT ICI results in a list of terms in format ANNANNN-NNnnnn and ANNANNN:NNnnnn (or ANNA-NNN-NNnnnn and ANNA-NNN:NNnnnn). SELECT automatically uses the formats defined by SET PATENT (Derwent or STN).

IPC Main Group Range Searchable

Qualifier

Search /MGR

Content and Search

The numeric search field /MGR contains the main groups of Current Main, Secondary, Additional, and Index IPCs in the format nnN. Leading zeros in the main group can be omitted. Since the /MGR field is not available for IPC Reform codes it is not applicable for these.

Each main group of IPC and the corresponding entry ANNA in the fields /IC, /ICM, /ICS, /ICA, and /ICI are tied together by (T) proximity.

```
=> S B31B/ICM (T) 31-37/MGR
      852 B31B/ICM
      1840678 31-37/MGR
L1      24 B31B/ICM (T) 31-37/MGR

=> d ipc
L1      ANSWER 1 OF 24 WPIX COPYRIGHT 2011          THOMSON REUTERS on STN

IC      ICM B31B-033/24
        ICS B31B-035/24
IPCR    B31B-0033/00 [I,C]; B31B-0033/14 [I,A]; B31B-0035/00 [I,C]; B31B-0035/14
        [I,A]
```

As the example above shows not just individual main groups but main group ranges can be searched. Leading zeros may be omitted.

IPC Subgroup Range Searchable

Qualifier

Search /SGR

Content and Search

The numeric search field /SGR contains the subgroups of Current Main, Secondary, Additional, and Index IPCs in the format nnNNN.

The search format consists of 5 digits, whereby the two leading zeros, that are possible, can be omitted. However, the subgroup needs to be filled with trailing zeros to a maximum of five digits (in case the first two ones are not zeros).

Since the /MGR field is not available for IPC Reform codes it is not applicable for these.

Examples for valid /SGR search terms:

Indexed Term	Definition
S 5000/SGR	displayed as ...-50
S 58000/SGR	displayed as ...-58
S 4000/SGR	displayed as ...-04
S 700/SGR	displayed as ...-007
S 8000-10000/SGR	

Each subgroup of IPC and the corresponding entry ANNANNN in the fields /IC, /ICM, /ICS, /ICA, and /ICI are tied together by (T) proximity. The subgroup of the IPC is range searchable:

```

IPC Reform

Qualifiers

Search /IPC.REF, /IPC, /IPC.KW, /IPC.VER
 Display IPC, IPCI, IPCR
 Select IPC, IPC.REF, IPC.F, IPCI, IPCR, IPC.A, IPC.C, IPC.CI, IPC.AI

Content

If they are available IPCI and IPCR contain the Current IPC Reform codes for the family.

STN splits the Current IPC Reform codes into two display fields, IPCI and IPCR, dependent on the level attribute of the IPC. IPCI contains IPCs with a level attribute of B (Original/Initial Classification). IPCR contains IPCs with a level attribute of R (Reclassification), D (Deletion) or V (Correction). IPCI and IPCR are display fields only.

Search

```
=> s G02C-0005/22/IPC.REF

L11 ANSWER 1 OF 756 WPIX COPYRIGHT 2011 THOMSON REUTERS on STN
IPC CODE          VERSION POS INV LEVEL CC ASSIGNMENT DATE STAT
-----
IPCI G02C-0007/04 (200601) F I Advanced O
IPCI G02C-0007/04 (2006) I Core O

```

will search all Current IPC Reform codes for the family at the Invention Level with an Original/Initial Classification, 'B' attribute.

The following attributes may be present at the Invention Level:

Attribute	Code	Definition
Version Indicator	YYYYMMDD	IPC version date
Class Level	A	Advanced level
	C	Core level
	S	Subclass level
Position	F	First invention information
	L	Later invention information
Scope	I	Inventive
	N	Non-Inventive/Additional
Level	B	Original Classification
	R	Reclassification
	V	Modified/Corrected
	D	Deleted

The Action Date, Applied and Office attributes are not supplied at the Invention Level as they are meaningless in the context of the compilation rules for Current IPCs from equivalent documents. All available attributes for the IPC are however searchable at the Patent Publication Level.

/IPC.VER is the search field for the IPC Version date.

Note: when searching attributes the level attribute "B" has been indexed as "O" and not "B" to avoid any confusion with "Basic".

IPC Thesaurus

An IPC thesaurus is attached to the /IPC field and allows the definitions of IPC codes to be viewed in their respective hierarchy. In addition it also allows searching across a range of IPC codes.

The IPC thesaurus is updated as soon as new or amended IPC codes are made available by WIPO (currently every three months for Advanced codes) and contains the classifications and catchwords for the main headings and subheadings from the 8th edition of WIPO IPC manual.

Hierarchies of terms in the thesaurus can be displayed using the EXPAND command followed by a plus symbol (+), a Relationship Code and /IPC e.g. E C01C003-00+ALL/IPC.

To use the thesaurus to automatically include additional Narrower, Broader, Related, and other terms in a search, the SEARCH command should be entered with a term followed by a plus symbol (+), a Relationship Code, and /IPC, e.g., S C01C+NT/IPC.

The following Relationship Codes may be used with the EXPAND and SEARCH commands in the IPC field:

Relationship Code	Description
ADVANCED (ADV)	Advanced Codes for the Core Level IPC Code
ALL	All associated terms
BRO (MAN)	Complete class
BT	Broader term
CORE (COR)	Core Codes for the Advanced Level IPC Code
ED	Complete title of the SELF term and IPC manual edition
HIE	Hierarchy terms (all broader and narrower terms)
INDEX	Complete title of the SELF term
KT	Keyword term
NEXT	Next classification
NT	Narrower term
PREV	Previous classifications
RT (SIB)	Related term
TI	Complete title of the SELF term and Broader Terms

=> e a61k+ti/ipc

E#	FILE	FREQUENCY	TERM
E1	WPIX	0	BT3 A/IPC SECTION A - HUMAN NECESSITIES
E2	WPIX	0	BT3 HEALTH; AMUSEMENT/IPC
E3	WPIX	0	BT2 A6/IPC
E4	WPIX	0	BT1 A61/IPC MEDICAL OR VETERINARY SCIENCE; HYGIENE
E5	WPIX	566593	--> A61K/IPC PREPARATIONS FOR MEDICAL, DENTAL, OR TOILET PURPOSES (bringing into special physical form A61J; chemical aspects of, or use of materials for deodorisation of air, for disinfection or sterilisation, or for bandages, dressings, absorbent pads or surgical articles A61L; compounds per se C01, C07, C08, C12N; soap compositions C11D; micro-organisms per se C12N)

***** END *****

Since for IPC Reform codes the numerical, range-searchable fields /MGR and /SGR are no longer being populated, the thesaurus can be conveniently employed to conduct range searching in the IPC Reform codes.

```
=> e
E13   WPIX           540      G02C0007-16/IPC.REF
E14   WPIX          1096      G02C0009/IPC.REF
E15   WPIX          1096      G02C0009-00/IPC.REF
E16   WPIX           127      G02C0009-02/IPC.REF
E17   WPIX           284      G02C0009-04/IPC.REF
E18   WPIX          2259      G02C0011/IPC.REF
E19   WPIX          2259      G02C0011-00/IPC.REF
E20   WPIX           534      G02C0011-02/IPC.REF
E21   WPIX           132      G02C0011-04/IPC.REF
E22   WPIX           213      G02C0011-06/IPC.REF
E23   WPIX           244      G02C0011-08/IPC.REF
E24   WPIX          2829      G02C0013/IPC.REF

=> s G02C0011-00-G02C0011-08/ipc
L12   2532 G02C0011-00-G02C0011-08/IPC (5 TERMS)
      (G02C0011-00+NEXT4/IPC)
```

For current awareness searches the thesaurus can also be employed to cover advance codes which are additionally emerging with revisions of the IPC Reform. This is particularly convenient when continuously updating search profile is to be kept at a minimum. Yet this does not cater for the rarer cases of new advanced codes for a topic being added in a separate hierarchy.

```
=> s G02C0011-00+adv/ipc
L13   2532 G02C0011-00+ADV/IPC (5 TERMS)
```

It can also serve to add core codes to an already known advanced code for more recall (possibly sacrificing precision).

```
=> s G02C0011-06+core/ipc
L14   2438 G02C0011-06+CORE/IPC (2 TERMS)
```

Display

For display purposes the normal condensed and indented display formats are available plus tabular formats both for the invention and the individual patent publications.

```
=> d ipc.tab
...
IPC  CODE              VERSION  POS  INV LEVEL  CC  ASSIGNMENT DATE  STAT
----  -
IPCI A45C-0011/04        (200601) L   I   Advanced  O
IPCI A45C-0011/04        (2006)   I   Core      O
IPCI C08L-0023/00      (200601) F   I   Advanced  O
IPCI C08L-0023/00      (2006)   I   Core      O
IPCI G02C-0011/00      (200601) L   I   Advanced  O
IPCI G02C-0011/00      (2006)   I   Core      O
```

The `HITCODE` format can be used to selectively display all codings including the IPC codes having led to a hit.

Set ICFORMAT command

The SET ICFORMAT command can be used to normalize IPC1-7 fields into an IPC Reform format with the longer Main Group for display purposes.

```
=> SET ICFORMAT ON
    Normalize IPC1-7 fields to IPC-8

=> SET ICFORMAT OFF
    Do NOT Normalize IPC1-7 fields to IPC-8

=> set icf on
SET COMMAND COMPLETED

=> d ic

IC   ICM A61K-0031/433; C07D-0285/10
     ICS A61K-0031/4436; C07D-0417/12; C07D-0417/14
```

Select

The following SELECT codes are available:

Code	Content
IPC	All IPC codes (IPC1-7 and IPC Reform)
IPC.REF	All IPC Reform codes
IPC.F	The 'lead' IPC code. Usually IPC Reform codes with a position attribute of "First" or an IPC1-7 ICM
IPCI	IPC Reform codes with a Level attribute of "Original"
IPCR	IPC Reform codes with a Level attribute of "Reclassification"
IPC.A	IPC Reform codes with a Class level attribute of "Advanced"
IPC.C	IPC Reform codes with a Class level attribute of "Core"
IPC.AI	IPC Reform codes with a Class level attribute of "Advanced" and Scope attribute of "Invention"
IPC.CI	IPC Reform codes with a Class level attribute of "Core" and Scope attribute of "Invention"

For statistical purposes IPC.F is particularly suitable since there is only one code for the entire invention.

Sort

The IPC.F codes can conveniently be used for sorting the documents to the perceived 'lead' IPC code. European Patent Classifications (ECLA, ICO)

Content

The European Patent Classification is an extension of the International Patent Classification which is being assigned by examiners at the EPO. There are about 134,000 classes in the ECLA vs. 71,000 in the IPC Reform. The ICO classification is an additional classification assigned for internal purposes by the EPO examiners. ICO codes are being used to describe secondary aspects of the invention, e.g. technical realisation. Both classifications are available in DWPI. Reclassifications are being made available in the database on a quarterly basis (the internal database at the EPO is dynamically reclassified).

European Patent Classifications (ECLA, ICO)

Content

The European Patent Classification is an extension of the International Patent Classification which is being assigned by examiners at the EPO. There are about 134,000 classes in the ECLA vs. 71,000 in the IPC Reform. The ICO classification is an additional classification assigned for internal purposes by the EPO examiners. ICO codes are being used to describe secondary aspects of the invention, e.g. technical realisation. Both classifications are available in DWPI. Reclassifications are being made available in the database on a quarterly basis (the internal database at the EPO is dynamically reclassified).

European Patent Classification (EPC, ECLA)

Qualifiers

Display EPC syn ECLA syn EPCLA
 Search /EPC syn /ECLA syn /EPCLA, /EPC.KW
 Select EPC syn ECLA syn EPCLA

Format

The ECLA codes have been indexed in a similar format as the IPC reform codes including a four digit main group. Akin to these the codes have been up-posted to reduce search times. The 'linked' EPCs are being resolved at STN as far as possible. The rules are outlined in the 'linked' EPC section

ANNA/EPC	Sub class level (Main Classes A to H)
ANNA-NNNN/EPC	Group level
ANNA-NNNN-Xxxxxx/EPC	Sub Group level

Where: A = letter
 N = number
 X = letter or number

Linked EPCs

The "+"-notation in ECLA is a way of indicating combinations of subject matter that are individually covered by separate entries in ECLA. This notation is only used in a few technical fields - most of them in organic chemistry. Their meaning is roughly comparable with the linked indexing in the IPC7. The way this is used, however, differs from field to field.

The "+M" notation

The +M notation is used to indicate additional details about the subject matter classified. For compositions containing one or more known active ingredients, e.g. formulations, synergistic mixtures, the symbol +M is added to the classification symbol, e.g. A01N39/02+M

Other "+letter" notations

The use of "+" letters for extended classification has been foreseen for subclass C10G in the ELCA scheme. After the notation of C10G9/00 to C10G69/14 have been separated with a + sign, notations may be added. These notations are selected from the following list:

- + **B** Obtained product gasoline
- + **D** Obtained product diesel oil
- + **G** Obtained product gasoil
- + **J** Obtained product Jet fuel
- + **L** Obtained product lubricating oil
- + **L1** Obtained product electrical isolation oil
- + **L2** Obtained product white oil, eating oil
- + **R** Starting material Residues
- + **S** Obtained product Solvents
- + **X1** Obtained product C2-C4 olefins
- + **X2** Obtained product higher olefins
- + **X3** Obtained product acetylene and homologues
- + **Y1** Obtained product fuel gas
- + **Y2** Obtained product propane and butane
- + **Z** Obtained product aromatics

Extensions can also be combined.

Processing

In order to arrive at a uniform implementation all across STN a standard procedure is employed.

1. The entire term including any slashes is used for display purposes in the display. There is no distinction between STN and Derwent style displays. The main group is padded with zeroes to four digits if needed.
2. The entire term including suffixes is indexed in /EPC after replacing the slash between main and sub group by a hyphen.
3. The STN style code (basis code) is indexed without any suffixes (before any plus sign)
4. The usual up-posting to the main group and subclass levels is performed as for the IPCs
5. Index suffixes are parsed at the plus sign (including any slashes) and indexed in /EPC.KW (ECLA keywords)
6. If there are suffixes including slashes, these are used to build variations of the basis code: The subgroup of the basis code is replaced with the suffix containing a slash code. If there are multiple suffixes containing slashes the procedure is repeated until all combinations of subclass and main group of the basis code and the subgroup suffixes have been built.

For instance C10G9/00+X1&Z is used to combine X1 and Z. Other variations are C10G9/00+X1+Z and C10G9/38+X1Y1

Indexing:

Here are some examples of codes and their corresponding index terms.

A. C10G9/38+X1&Y1	
C10G0009-38+X1&Y1	/EPC
C10G0009-38	/EPC
C10G0009	/EPC

B01D0009-00B4	/EPC
B01D0009-00C6	/EPC
B01D0009-00E	/EPC
B01D0009-02	/EPC

and

/00C6	/EPC.KW
/00E	/EPC.KW
/02	/EPC.KW

EPC Thesaurus

An EPC or ECLA thesaurus is attached to the /EPC field and its synonyms and allows the definitions of EPC codes to be viewed in their respective hierarchy. In addition it also allows searching across a range of EPC codes.

The EPC thesaurus is updated on a monthly basis and contains the classifications and catchwords for the main headings and subheadings issued by the EPO.

Hierarchies of terms in the thesaurus can be displayed using the EXPAND command followed by a plus symbol (+), a Relationship Code and /EPC e.g. E Co1Coo3-00+ALL/EPC.

To use the thesaurus to automatically include additional Narrower, Broader, Related, and other terms in a search, the SEARCH command should be entered with a term followed by a plus symbol (+), a Relationship Code, and /EPC, e.g., S Co1C+NT/EPC .

The following Relationship Codes may be used with the EXPAND and SEARCH commands in the EPC field:

Relationship Code	Description
ALL	All associated terms
BT	Broader term
CODE	ECLA code
DEF	Definition of an ECLA code
HIE	Hierarchy terms (all broader and narrower terms)
KT	Keyword term
NEXT	Next classification
NT	Narrower term
PREV	Previous classifications
TI	Complete title of the SELF term and Broader Terms

Select ICO

Format

The ICO code format matches the EPC format yet the first letters A to H have been replaced by K to T in order to be able to tell them apart.

ANNA/ICO Sub class level (Main Classes K to T)
ANNA-NNNN/ICO Group level
ANNA-NNNN-Xxxxxx/ICO Sub Group level

Where: A = letter
N = number
X = letter or number

The 'linked' ICOs are being resolved exactly like the EPCs yet with the additional complication that a colon can be used as the separator between main and sub-group.

Search

The colon separators are being retained, but a search field edit will also allow a hyphen to be used instead.

ICO Thesaurus

An ICO thesaurus is attached to the /ICO field and allows the definitions of ICO codes to be viewed in their respective hierarchy. In addition it also allows searching across a range of ICO codes.

The ICO thesaurus is updated on a monthly basis and contains the classifications and catchwords for the main headings and subheadings issued by the EPO.

Hierarchies of terms in the thesaurus can be displayed using the EXPAND command followed by a plus symbol (+), a Relationship Code and /ICO e.g. E Co1Coo3-oo+ALL/ICO.

To use the thesaurus to automatically include additional Narrower, Broader, Related, and other terms in a search, the SEARCH command should be entered with a term followed by a plus symbol (+), a Relationship Code, and /ICO, e.g., S Co1C+NT/ICO.

The following Relationship Codes may be used with the EXPAND and SEARCH commands in the ICO field:

Relationship Code	Description
ALL	All associated terms
BT	Broader term
HIE	Hierarchy terms (all broader and narrower terms)
KT	Keyword term
NEXT	Next classification
NT	Narrower term
PREV	Previous classifications
TI	Complete title of the SELF term and Broader Terms

=> e k01b+all/ico

E#	FILE	FREQUENCY	TERM
E1	WPINDEX	0	BT3 K/ICO SECTIONS K TO T: ICO INDEXING SCHEMES.
E2	WPINDEX	0	BT2 K01:/ICO
E3	WPINDEX	0	BT1 K01/ICO
E4	WPINDEX	134	--> K01B/ICO INDEXING SCHEME RELATING TO SOIL WORKING IN AGRICULTURE OR FORESTRY, AND TO PARTS, DETAILS, OR ACCESSORIES OF AGRICULTURAL MACHINES OR IMPLEMENTS, IN GENERAL
E5	WPINDEX	50	NT1 K01B0043/ICO
E6	WPINDEX	41	NT2 K01B0043:00/ICO Gathering machines provided with additional devices e.g. conveyer belts, sieves (N9409)
E7	WPINDEX	9	NT3 K01B0043:00B/ICO provided with drum sieves (N9409)
E8	WPINDEX	68	NT2 K01B0049:00A/ICO Devices for the connection of two or more implements or machines (N9409)
E9	WPINDEX	11	NT2 K01B0063:00R/ICO Lifting devices for soil-working instruments provided with remote or auxiliary control means, i.e. operated from other than the driving position (N9409)
E10	WPINDEX	5	NT2 K01B0063:111S/ICO Slippage detection or control (N9409)

***** END *****

Ranges of ICO codes can be conveniently searched for by employing the thesaurus.

US National Patent Classification (NCL)

Qualifiers

Display NCL
 Search /NCL, /NCLM, /NCLS
 Select NCL, NCLM, NCLS
 Sort NCL

Format

The search format follows the uniform approach taken at STN. This includes up-posting of the long codes to reduce search times.

Displayed Classification:

MMM/SSS.DDDAAA

Indexed terms:

1.MMMSSDDDDAAA
 2.MMMSSDDD
 3.MMM

The AAA letter section is optional. The delimiters are being automatically removed when the query is being processed.

Content

The United States Patent and Trademark Office (USPTO) uses the US Patent Classifications (USPC) to organize US patent documents into smaller collections based on common subject matter.

U.S. Patent Classification codes in DWPI are now updated with any recent changes to classifications made by examiners. Reclassifications made since the original USPTO filing have also been added to the DWPI backfile.

Search

The codes have been indexed without delimiters. For your convenience any codes input with delimiters for searching are automatically being edited to remove them.

USNCL Thesaurus

A thesaurus is attached to the /NCL field and allows the definitions of NCL codes to be viewed in their respective hierarchy. In addition it also allows searching across a range of NCL codes.

The US National Patent Classification thesaurus is attached to the /NCL field and allows the definitions of NCL codes to be viewed in their respective hierarchy. The relationships can also be employed to facilitate searching.

The definitions of the codes have also been parsed, and added to the thesaurus (KT or keywords terms) to allow for identifying appropriate codes for a certain topic.

The US NCL thesaurus may be updated periodically subject to availability of the data.

Hierarchies of terms in the thesaurus can be displayed using the EXPAND command followed by a plus symbol (+), a Relationship Code and /NCL e.g. 'e 257E21685+all/ncl'.

To use the thesaurus to automatically include additional Narrower, Broader, Related, and other terms in a search, the SEARCH command should be entered with a term followed by a plus symbol (+), a Relationship Code, and /NCL, e.g., 's 257E21685+nt/ncl'.

Range searching of codes is available.

The following Relationship Codes may be used with the EXPAND and SEARCH commands in the NCL field:

Relationship Code	Description
ALL	All usually required terms (BT, SELF, DEF, NT)
AUTO (1)	Automatic relationship (BT, SELF, DEF, NT)
BT	Broader Terms (BT, SELF)
CODE	Classification Code (SELF, CODE)
DEF	Definition (SELF, DEF, DEF2, DEF3, DEF4)
HIE	Hierarchy Terms (BT, SELF, DEF, NT)
KT	Keyword Terms (SELF, KT)
MAX	All associated Terms (BT, SELF, DEF, DEF2, DEF3, DEF4, NT, KT)
NEXT	Next classification within the same class
NEXT(n)	Next n classifications within the same class
NT	Narrower Terms (SELF, NT)
PREV	Previous Code within the same class
PREV(n)	Previous n classifications within the same class
TI	Complete title including Broader Terms (SELF, BT, SELF, DEF (BT))

=> e 257E21685+all/ncl

Japanese Patent Classifications (FI-Terms, F-Terms)

Content

The Japanese Patent Office (JPO) employs two different systems for the classification of Japanese patent documents. The FI-Terms which have been derived from the IPC by extension akin to the ECLA codes of the EPO. The FI codes have finer divisions at the sub-group level. The F-Terms have been developed independently of the FI-Terms in order to cope with demanding recent technological developments. The F-Terms are more amenable to computer-assisted searching and allow approaching technologies from various different 'viewpoints'. With the advent of the IPC Reform the FI system has been modified to bring it more into compliance with the reformed system. FI and F-Terms are being revised once a year.

FI-Terms

Qualifiers

Search /FCL syn /JPC, /FMCL, /FSCL, /FICL, /FACL
 Display FCL syn JPC
 Select FCL syn JPC, FMCL, FSCL, FICL, FACL

Format

The search format resembles the approach taken at STN for the IPCs. This includes normalising the main group to four digits and up-posting of the long codes to reduce search times. There are main, secondary, index and additional FI-Terms available like in the IPC version 6. Linked index terms can be linked with the (S) proximity operator. There is also an optional three-letter 'broad facet' or 'facet' categorization available which appears in parenthesis in the display next to the corresponding FI term.

Displayed Classification:

ANNANNNN/NNnnnn A or ANNANNNN/NNnnnn NNN or
 ANNANNNN/NNnnnn NNN D optional: (AAA)

Indexed terms:

1. ANNANNNN-NNnnn a
 or
 ANNANNNN-NNnnn nnn
 or
 ANNANNNN-NNnnn nnn A
2. ANNANNNN-NNnnn
3. ANNANNNN
4. ANNA

The optional facet: AAA

Index terms can have a colon instead of the slash separating main and subgroup.

Content

The File Index or FI Terms are similar in structure to the IPC. In fact it had originally been based on the IPC version 4 and then being extended with finer divisions on the subgroup level. While the IPC has about 70,000 codes, the FI has about 190,000, the ECLA about 120,000 and the US classifications 160,000 entries.

Search

The FI terms can be searched for like the IPCs at STN. For technology areas where there is F-Term indexing available, this may be preferable. Else both indexing systems can be leveraged side by side and even searched for in unison. A search field edit for reformatting codes incorporating slash delimiters or padding main groups to four digits is available for both search fields.

      NOVELTY - The method involves dripping two types of polarity liquids with
      different microstructures on a surface. The contact angle of the droplet
      formed using the liquids, is measured and the surface free energy is
      computed from the measured contact angle.
      DETAILED DESCRIPTION - The liquids of different polarities are
      chosen from carbonic acid diesters of two types. The mixture of carbonic
      acid diesters of two types contains cyclic carbonic acid diester with 3-6
      ...

FTerms**Qualifiers**

Search /FTRM syn /FTRM syn /FTCLA syn /JPCLA
 Display FTRM syn FTRM syn FTCLA syn JPCLA
 Select FTRM syn FTRM syn FTCLA syn JPCLA

Format

The search format is entirely different from the FI-Terms. It consists of two parts: the five character 'theme' code, and a 'term code' consisting of a two-letter 'viewpoint' and a two digit 'figure'. The theme code consists of two characters identifying the JPO examining division followed by three digits for a broad search category. An optional additional (extension) character can also be added in certain areas. Theme code and term code (viewpoint+figure) can be independently searched for and combined into the complete code as required. The entire codes are indexed as well.

Displayed Classification:

NANNN/AANN.A

Indexed terms:

1. NANNN/AANN.A
2. NANNN/AANN
3. NANNN
4. AANN

Content

The File Forming Terms or FTERMS form an independent indexing system in its own right. There are about 1,800 theme codes for FTERMs plus 800 FI theme codes (which don't have a Viewpoint attached to it) and 22,000 viewpoints making up 340,000 codes overall. Since 2000 the F-terms have been printed in full on the unexamined patent applications.

The FTERMs have been designed with the indexing of technical fields in the invention in mind rather than IPCs which classify the main inventive feature. They are assigned in technical areas where the FI-terms don't offer sufficient precision for search purposes. F-terms focus on detailed technical segments viewed under various angles (viewpoints like application or manufacturing process). This can be advantageous when conducting prior art or freedom-to-operate searches. The codes are not only assigned based on the claims on an application, but also on the basic specification.

Search

The F-Terms can be searched for as a complete code or theme and code term independently optionally linked by sentence proximity.

F-Term Thesaurus

An F-Term thesaurus is attached to the /FTERM field and its synonyms and allows the definitions of F-Term codes to be viewed in their respective hierarchy. The relationships can also be employed to facilitate searching.

The definitions of the codes have also been parsed added to the thesaurus (KT or keywords terms) to allow for identifying appropriate codes for a certain topic.

The F-Term thesaurus may be updated periodically subject to availability of the data.

Hierarchies of terms in the thesaurus can be displayed using the EXPAND command followed by a plus symbol (+), a Relationship Code and /FTERM e.g. e 2b002/aa09+ti/fterm.

To use the thesaurus to automatically include additional Narrower, Broader, Related, and other terms in a search, the SEARCH command should be entered with a term followed by a plus symbol (+), a Relationship Code, and /FTERM, e.g., e 2b002/aa09+nt/fterm.

The following Relationship Codes may be used with the EXPAND and SEARCH commands in the FTERM field:

Relationship Code	Description
ALL	All associated terms
BT	Broader term
CODE	Code for the thesaurus text term
DEF	Definition
HIE	Hierarchy terms (all broader and narrower terms)
KT	Keyword term
NT	Narrower term
RFI	Related FI (File Indexing) classification term
TI	Complete title of the SELF term and Broader Terms

Content

Since 1974, Derwent World Patents Index has included patent specifications irrespective of subject. These are divided into three major subject areas corresponding to the following Derwent Class sections:

Class Section	Full Title and Coverage
CPI	Chemical Patents Index (Sections A-M)
EngPI (GMPI)	Engineering Patents Index (Sections P-Q)
EPI	Electrical Patents Index (Sections S-X)

All references in CPI, EngPI, and EPI have been assigned to the appropriate file segment.

Search

The file segment information can be used in combination with search terms that have alternative meanings in different areas of technology.

```
=> S PLASMA AND EPI/FS
      173103 PLASMA
      8288559 EPI/FS
L2      130779 PLASMA AND EPI/FS
```

Because each file segment has a very high number of records, other search criteria should be used to limit the search where possible e.g. the detailed Class.

```

Content

Thomson Reuters (Scientific) classifies all basic patents according to their subject content into one or more of 21 subject areas. These are designated A to M (Chemicals), P to Q (Engineering) and S-X (Electrical) and are further divided into three-character classes.

The classifications for A-M and S-X are applied by Thomson Reuters (Scientific) subject specialists. Classes for the engineering sections P and Q are derived auto-

matically from the International Patent Classification (IPC) assigned by the issuing patent authorities. Consequently a search of the P and Q series classes is equivalent to a broad IPC search and care should be taken with such searches since IPCs are not consistently applied by the different patent authorities.

For records entered prior to 1970, Classes A (Plasdoc), B (Farmdoc), and C (Agdoc) were assigned at the single-letter section level. From 1970, the full three-character Class codes were assigned. When equivalents were added to pre-1970 records the record was normally reclassified and thus some pre-1970 records do have complete Class codes.

A complete list of the Classes is available in the Classification Guide available from Thomson Reuters (Scientific) Technical Support.

Section R

Class R (electrical section) was replaced by classes S, T, U, V, W and X in 1980. Records in the database no longer contain R classes as superior equivalent S-X classes were added at that time.

See also the chapters on File Segments and on Manual Codes.

Search

Both the full and single-letter forms of the Classes are directly indexed. Truncation may be used for searching at levels more specific than the single-letter level but not as specific as the full class level:

```
=> S D/DC AND Q3#/DC
      1131578 D/DC
      787806 Q3#/DC

Manual Codes

Qualifier

Search /MC
 Display MC
 Select MC

Format

ANN-ANNANA/MC

Where: A = Manual code letter
 N = Manual code number

CPI manual codes are searchable by eligible subscribers only within the Manual Code field (/MC). If you are an eligible subscriber, you must apply to Thomson Reuters (Scientific) to have the correct access conditions applied to each STN Login ID.

EPI and EngPI (GMPI) manual codes are open access.

Content

Manual codes are similar to broad descriptors and have a hierarchical structure, with section, subsection, group, subgroup, division and subdivision levels. They are more detailed than the Class and are assigned to basic patents in Sections A-M (Chemical Patents Index; CPI), Section Q (Engineering Patents Index; EngPI, Transportation only) and Sections S-X (Electrical Patents Index; EPI).

Manual code assignment is based only on the main inventive features of a basic patent, although both the patented matter and the applications are coded.

Manual codes have been applied from the beginning of coverage of each of the sections with the exception of Section Q Transportation manual codes which were introduced at the beginning of 2006. Manual codes for catalysts, which begin with the letter N, have been in use since 1977.

Each code has one of the following formats:

Code Format	Definition
ANN	section letter and subsection number, e.g. B12
ANN-A	group letter added, e.g. B12-G
ANN-ANN	subgroup number added, e.g. B12-G01
ANN-ANNA	division letter added, e.g. B12-G01B
ANN-ANNAN	subdivision number added, e.g. B12-G01B1
ANN-ANNANA	10 characters for some new EPI codes from 199201

Note the need to insert zeros - the subsection and subgroup must always be two-digit numbers, hence B12-G01, but the subdivision number is always a single-digit.

Manual Codes and IPCs

Although manual codes are similar to IPCs in their application and level of specificity, the two differ in a number of important ways:

- IPCs cover a broader range of subject matter than Manual Codes
- IPCs are applied differently by different patent offices around the world, while Manual Codes are assigned consistently by Thomson Reuters (Scientific) Indexers
- Manual Codes have a logical hierarchy
- Manual Codes are only assigned to the Basic member of the DWPI family. IPCs are available for both Basic and equivalent documents.

For further information see the CPI Manual Codes and EPI Manual Codes user guides.

Search

Since Manual Codes are hierarchical in format, truncation can be used to retrieve all codes assigned to an intermediate level as well as the more specific codes below that level. However, truncation should be used with care because very large sets of records can result if Manual Codes are truncated too far to the left.

There are two types of searches whose results are likely to be enhanced by using Manual Codes:

1. A broad subject search, choosing an appropriate point at which to truncate after studying the CPI or EPI Manual Codes.
2. A specific subject search that will require a specific manual code plus general codes to cope with the cases where the original document was not specific, but could be of interest.

The following search involves using Manual Codes to look for electromagnetic relays (V03-D04):

```

=> S V03-D04/MC
V03-D04 ELECTROMAGNETIC RELAYS
L2      1901 V03-D04/MC

=> d 1-2 ti mc

L2      ANSWER 1 OF 1901 WPIX COPYRIGHT 2011 THOMSON REUTERS on STN
TI      Power relay assembly for contact systems has armature seat which has taper
        along surface, to provide substantially constant attractive force along
        stroke length
MC      EPI: V02-C; V02-E02; V03-D02; V03-D03A; V03-D03B; V03-D03C; V03-D04

L2      ANSWER 2 OF 1901 WPIX COPYRIGHT 2011 THOMSON REUTERS on STN
TI      Gas break induction switch for curing desk handle, has relay drive circuit
        module connected with gas break relay that is accessed to microprocessor,
        and metal induction sheet connected on capacity induction circuit module
MC      EPI: T01-C08; U21-A03; U21-B02C1; V03-D01; V03-D02; V03-D04; V03-D05E;
        X25-L01A

```

To facilitate search on subsection level all codes have been up-posted with code ANN. In this case no truncation is necessary (V03: switches, relays):

```

=> S V03/MC
L3      62357 V03/MC

```

It should be noted that there are a number of Manual Codes which comprise 3 alphanumeric characters only (ANN) such as E23 (Phthalocyanine Dyes). These have been indexed with a "&" appended so that they can be directly searched without also retrieving associated narrower terms.

```
=> S "E23"/MC
E23 PHTHALOCYANINE (MACROCYCLIC) DYES (GENERAL)
L3      8921 "E23"/MC

=> S "E23&"/MC
E23& PHTHALOCYANINE (MACROCYCLIC) DYES (GENERAL) (SPECIFICALLY INDEXED)
L4      697 "E23&"/MC
```

A search on aramid fibres for tyre cords could look as follows (Manual Codes in the example are A05-F05 for aramids, valid from 1986 onwards, A12-T01C for polymeric tyre cords, and F04-E01 for tyre cords with chafer fabric):

```
=> S (A05-F05 AND (A12-T01C OR F04-E01))/MC
A05-F05 POLYAMIDES FROM AROMATIC DICARBOXYLIC ACID(S) AND AROMATIC DIAMINE(S) ONLY
A12-T01C TYRE CORD (POLYMERIC ONLY); TYRE CORD ADHESIVES (POLYMERIC ONLY)
F04-E01 TYRE CORD, CHAFER FABRIC
      5507 A05-F05/MC
      3238 A12-T01C/MC
      2308 F04-E01/MC
L5      272 (A05-F05 AND (A12-T01C OR F04-E01))/MC
```

Manual Code Thesaurus

The definitions of the Manual Codes can be found in the CPI Manual Codes and EPI Manual Codes user guides. The same information can also be found online through the Manual Code thesaurus feature. This thesaurus is being revised on an annual basis.

When you request an alphabetic EXPAND display of the /MC field, a column labelled AT (Associated Terms) will be included in which the number indicates the number of Broader, Narrower, Related, etc., terms that are associated with the term in that E number line in the thesaurus. You may also use the EXPAND command to request a display of hierarchies of terms in the thesauri.

Use the EXPAND command with a term, followed by a plus (+) symbol, a Relationship Code, and /MC, e.g.

```
=> E A05-A01A+BT/MC
E#   FILE   FREQUENCY   TERM
--   ----   -
E1   WPIX    449595      BT3 A05/MC
      DEF CONDENSATION POLYMERS
E2   WPIX    1152        BT2 A05-A/MC
      DEF EPOXY RESINS (OTHERS)
E3   WPIX    583         BT1 A05-A01/MC
      DEF EPOXY RESINS (GENERAL) *
      HNTE (1966-1967)
E4   WPIX    519 --> A05-A01A/MC
***** END *****
```

The following Relationship Codes can be used with the EXPAND and SEARCH commands in the Manual Codes (/MC) field:

Relationship Code	Description
ALL	All Associated Terms (BT, SELF, HNTE, DEF, RT, NT)
BT	Broader Terms (BT, SELF)
NT	Narrower Terms (NT, SELF)
RT	Related Terms (SELF, RT)

Polymer Coding and Indexing

Polymer information has been indexed for patents classified in section A: Polymers and Plastics since 1966.

The original polymer indexing was the Plasdoc punch code or fragmentation code also known as AM codes (Section A Multipunch). These codes were based upon relative positions on a punch card and concepts were represented by groups of these punch codes. This indexing system was a big step forward, but it still allowed false drops in searches and relevance was not as high as desired.

In 1978, Key Serial numbers (KS) were created from pre-coordinated groups of punch codes. The obvious benefit of these key serials was the ability to search specifically for those concepts to which they had been assigned.

Plasdoc Registry Compounds, with corresponding registry numbers, were incorporated into the system in 1984. These compounds represented the most commonly occurring additives and catalysts in polymers, which, via the registry numbers, could be searched specifically.

In update 199332, a new system for indexing and searching polymer related information was introduced – Enhanced Polymer Indexing. Both polymer coding and indexing were produced side by side for a transition period.

Year Ranging

Modifications in the coding system (normally additions) have been made at various times over the years. Consequently, a search is frequently done in stages in order to use the best strategy available during each time period.

To avoid having to use the accession year parameters, the following control codes have been added to all subfields:

Section A Control Codes

01&	1966 - mid 1968
01-	mid 1968 – 1971
012	1972 – 1976
010	1977
011	1978 – 1981
013	1982 – 1983
014	1984 - 1993 (Update 199331)
017	1993 (Update 199332) – 1995
018	1996 – 2003
2004	2004 -

Polymer Coding

Fragmentation Codes

Qualifiers

Search /FG (synonym /AM)
 Display PLC, FG (synonym AM)
 Select FG

Format

NNX

Where: NN = number
 X = a number, "-" or "&"

Polymer fragmentation codes are searchable by eligible subscribers only. If you are an eligible subscriber you must apply to Thomson Reuters (Scientific) to have the correct access conditions applied to each STN LoginID.

Content

Polymer fragmentation codes describe both specific and generic concepts found in the patent specification. Codes were applied to all concepts disclosed or claimed in the specification. Polymer fragmentation coding was initially assigned to records that included a basic from a major patent-issuing authority and for which an abstract had been published. Basics from other authorities and certain Japanese documents, which had no abstracts, did not have the coding applied until the first appearance of an equivalent from one of the major patent-issuing authorities.

Further details of this coding can be found in the CPI Polymer Coding Systems user guide.

Polymer fragmentation codes were discontinued as of update 199501, and were replaced by the Enhanced Polymer Indexing system.

Search

A record often contains more than one distinct fragmentation code subfield, representing a specific aspect of the invention, e.g. one specific copolymer, or all the variants of a specific aspect. Fragmentation codes with - in one subfield are indexed with (P) proximity. You do not need to specify the (P) operator as implied (P) proximity is active in field /FG.

Plasdoc Key Serials

Qualifiers

Search /KS
 Display PLC, KS
 Select KS

Format

NNNN

Where: NNNN = four digit code

The Polymer Key Serials field (/KS) is searchable by eligible subscribers only. If you are an eligible subscriber you must apply to Thomson Reuters (Scientific) to have the correct access conditions applied to each STN LoginID.

Content

Polymer Key Serial Numbers provide a concise mechanism for searching plastics and polymer concepts. Approximately 3,500 key serial numbers are available, e.g. 0248 is used to retrieve polypropylene.

Key serials are present from the beginning of 1978 until the end of 1994. Additional more specific key serials were introduced at the beginning of 1982 and are numbered in the 3,000 series.

Indexing with Polymer Key Serials was discontinued from update 199501, having been replaced by the Enhanced Polymer Indexing system.

Key serial numbers were initially assigned to basics from major patent-issuing authorities that included abstracts. Basics from other authorities and certain Japanese documents that had no abstracts did not have key serials applied until the appearance of an equivalent, with an abstract, from a major patent issuing authority.

Search

Key serials are searched as their 4-digit number. They are linked by (P) proximity to all polymer fragment codes (field /FG) in a record. An alternative is to use AND instead of (P) proximity.

Polymer Key Serials Dictionary

The Polymer Key Serials codes in field /KS can be looked up in an online dictionary. For example expanding on the definitions for the codes in field /KS, e.g. => E GASEOUS/KS will provide an alphabetical list around the term gaseous. The list also shows the number of codes associated with the term (AT column).

=> E GASEOUS/KS				
E#	FILE	FREQUENCY	AT	TERM
---	----	-----	--	----
E1	WPIX	0	1	GALLIUM IN POLYMER, MONOMER OR CONDENSANT/KS
E2	WPIX	0	3	GAS/KS
E3	WPIX	0	4 -->	GASEOUS/KS
E4	WPIX	0	1	GASEOUS COPOLYMERISATION/KS
E5	WPIX	0	1	GASEOUS HOMOPOLYMERISATION/KS
E6	WPIX	0	1	GASEOUS OLIGOMERISATION/KS
E7	WPIX	0	1	GASEOUS POLYCONDENSATION/KS
E8	WPIX	0	1	GASKETS/KS
E9	WPIX	0	1	GEARS, /KS
E10	WPIX	0	1	GEARS, BEARING SURFACE/KS
E11	WPIX	0	6	GELLING/KS
E12	WPIX	0	1	GELLING AGENT, THICKENER/KS

An expand using the “+ALL” relationship shows all the codes and their definitions:

```

=> E GASEOUS+ALL/KS
E#   FILE           FREQUENCY      TERM
--   ----           -
E1   WPIX           0          --> Gaseous/KS
E2   WPIX           1965       CODE 3209/KS
                DEF  Gaseous homopolymerisation
E3   WPIX           1719       CODE 3210/KS
                DEF  Gaseous copolymerisation
E4   WPIX           155        CODE 3211/KS
                DEF  Gaseous oligomerisation
E5   WPIX           965        CODE 3212/KS
                DEF  Gaseous polycondensation
***** END *****

```

You may also use definitions or single words from the key serial definitions in a search in field /KS. A search using a key serial code definition or a single word from it together with the “+ALL” relationship takes all codes associated with the term into the search.

For example, in the case of a search on “GASEOUS+ALL/KS”, the four codes that present definitions containing “gaseous” are searched. The system states the number of terms searched as 5, counting the 4 codes plus the term “gaseous” itself.

```

=> S GASEOUS+ALL/KS
L1          3054 GASEOUS+ALL/KS (5 TERMS)

```

When using key serial codes in a search in field /KS, the codes are echoed, i.e. their definitions are shown automatically. Use echoing to check your searches in /KS.

```

=> S 3209/KS
3209 Gaseous homopolymerisation
L2   1965 3209/KS

```

Polymer Indexing Enhanced

Qualifier

Search /PLE
 Display PLE
 Select PLE

Format

See code formats in the table below.

The Enhanced Polymer Indexing field is searchable by eligible subscribers only. If you are an eligible subscri-

ber you must apply to Thomson Reuters (Scientific) to have the correct access conditions applied to each STN LoginID.

Content

Enhanced Polymer Indexing was introduced in update 199332 to replace the Polymer Fragmentation Codes and Polymer Key Serial Numbers, both of which were discontinued as of update 199501.

The indexing is a hierarchical system divided into facets, each facet containing codes with a specific format:

Facet	Code Format	
Polymer Formers	Gnnnn	Generic Codes
	Rnnnnn	Specific Compound Numbers
	Polymer Types	Pnnnn
Natural Polymers	Gnnnn	Generic Codes
	Rnnnnn	Specific Compound Numbers
Modified Polymers	Mnnnn	
Chemicals	Gnnnn, Rnnnnn	
Chemical Aspects	Dnn, Enn, Fnn, symbols for elements and groups of the periodic table	
Novelty Descriptors	NDnn	
Universal Terms	Knnnn	
Polymer Descriptors	Hnnnn	
Shape & Form	Snnnn	
Additives	Annnn	
Catalysts	Cnnn	
Chemical Processes	Lnnnn	
Physical Operations	Nnnnn	
Equipment	Jnnnn	
Properties	Bnnnn	
Applications	Qnnnn	

Where n represents a single digit

DCR numbers are also available for search and display within the PLE field. These DCR numbers have been auto-generated from the corresponding Specific Compound Numbers present in the Enhanced Polymer Indexing.

Polymer Indexing is applied to all polymer concepts from the claims and claim-related examples in the specification. The indexing is initially assigned to records that include a basic patent from a major patent-issuing authority, and for which an abstract is published. Basics from other authorities which do not have abstracts do not have the indexing applied until the first appearance of an equivalent from one of the major patent-issuing authorities.

For details about the content of and indexing in each facet, please consult the following user guides available from Thomson Reuters (Scientific):

- Polymer Indexing Dictionary
- Polymer Indexing Hierarchy
- Polymer Indexing Reference Manual
- Polymer Indexing System Description
- Polymer Indexing Thesaurus

Search

For each of the terms of the Polymer Indexing Enhanced (/PLE) field the appropriate Broader Terms (BT), Narrower Terms (NT), Used For (UF) terms etc., are available. This thesaurus is available online. It allows you to identify broader, narrower, related terms etc. quickly without reference to the printed version and to search all these associated terms automatically. See below for a detailed description of the thesaurus feature.

If the thesaurus feature is not used, searching and expanding in the /PLE field is equivalent to that in other fields. An EXPAND on a term (code or text term) in the Polymer Indexing Enhanced field will show an alphabetical listing of terms around your desired term with the actual number of postings (FREQUENCY). In addition, the Associated Terms (AT) column indicates the number of associated terms in the thesaurus. olumn indicates the number of associated terms in the thesaurus.

```

=> E R05082/PLE
E#      FILE          FREQUENCY    AT      TERM
--      ----          -
E1      WPIX              470         2      R05079/PLE
E2      WPIX              172         2      R05081/PLE
E3      WPIX              75          2 -->  R05082/PLE
E4      WPIX             16328        6      R05085/PLE
E5      WPIX             9999         6      R05086/PLE
E6      WPIX              47          2      R05089/PLE
E7      WPIX              50          2      R05093/PLE
E8      WPIX              41          2      R05094/PLE
E9      WPIX              143         2      R05096/PLE
E10     WPIX             1977         2      R05099/PLE
E11     WPIX              55          2      R05104/PLE
E12     WPIX              8           2      R05105/PLE

```

In /PLE, the text of the enhanced polymer codes must be searched as bound phrases. Use of EXPAND to check the exact wording of a multi-word term is therefore recommended.

```

=> s e4+all
L9      55433 "BORON <CHEMICAL ASPECTS>"+ALL/PLE (5 TERMS)

```

Note that terms, like boron, may occur in different facets.

The terms may be searched for with and without the facet.

There are two kinds of auto posting in the /PLE field, upwards posting of Broader Term(s), and 'cross posting' of chemical aspects.

In most facets the enhanced polymer codes are arranged hierarchically. Any given term within a hierarchy will autopost the corresponding Broader Term(s) within the hierarchy. Thus e.g. alpha-Methyl styrene will autopost vinyl aromatics monoolefinic, which in turn will autopost monoolefinic. Terms which have actually been indexed, rather than autoposted, can be searched by adding '-R' to the end of the code.

Vinyl aromatics monoolefinic which has been indexed, should be searched:

```
=> S G0102-R/PLE
L6      18455 G0102-R/PLE
```

Searching G0102 will retrieve all references - actually indexed and autoposted.

Specific compound numbers generate the appropriate chemical aspects. Each specific compound number and its aspects are tightly tied together (see below). For the generic concepts some chemical aspects will be autogenerated, more may be applied during indexing if the information is available.

To improve retrieval, Linking Groups and Linking Levels are used to associate related concepts. Within a record there will be one or more linking groups, each representing a polymer or family of polymers and all concepts related to that polymer or family of polymers.

Within each Linking Group there are three levels of linking each with its own proximity operator:

Level 1	to chemically describe a substance	(S)
Level 2	to link the substance to its function	(P)
Level 3	to link other related terms to the substance	(L)

Level 1

The proximity operator (S) is used to link chemical aspects to generic terms and to specific compounds. For example, to search for aliphatic diisocyanates:

```
=> S (G1854 (S) D10)/PLE
      18898 G1854/PLE
      589318 D10/PLE
L7      16305 (G1854 (S) D10)/PLE
```

Level 2

The proximity operator (P) is used to associate a chemical or compound with its function or use, such as homopolymer or additive. For example, to search for vinyl chloride, and its function (binary copolymer):

```
=> S (R00338 (P) H0022)/PLE
      42072 R00338/PLE
      169254 H0022/PLE
L8      3868 (R00338 (P) H0022)/PLE
```

Level 3

The proximity operator (L) is used to link concepts such as properties and applications to a compound or group of compounds. At this level additives and catalysts can be, for example, linked to a polymer. For example, to search aramid, tyre cord, and tensile strength

```
=> S ((P0737 (P) S1672) (L) B4171)/PLE
      11331 P0737/PLE
      5301 S1672/PLE
      24929 B4171/PLE
L9      25 ((P0737 (P) S1672) (L) B4171)/PLE
```

In displays, codes tied together on level 1 ((S) operator) are listed separated by blanks. They define a set. All sets of codes linked together on level 2 ((P) operator) are listed in one block, sets separated by ";", and preceded by a number. Each linking group ((L) operator) is grouped together. The digit in front of the full stop indicates the number of the link group, the digit behind the full stop counts the (P)-links in one link group, e.g.:

```

DCN: R00326 DCR: 1013; H0000; S9999 S1285-R; P1150; P1161
```

Polymer Indexing Enhanced Thesaurus

The Polymer Indexing Enhanced (/PLE) Thesaurus provides lists (hierarchical and relational) of all terms associated with a given thesaurus term online. The STN thesaurus feature allows associated terms to be identified quickly without reference to the printed version (EXPAND), and to incorporate these terms automatically into a search.

The EXPAND command can be used to see a list of terms associated with a given thesaurus term (SELF term) with any of the following relationship codes:

Term	Description
ALL	All Associated Terms (BT, SELF, NOTE, USE, SEE, UF, NT, RT)
AUTO	Automatic Relationship (SELF, USE, UF)
BT	Broader Terms (also BT1=1st Level, BT2=2nd Level etc.)
HIE	Hierarchy Terms (BT, SELF, NT)
KT	Keyword Terms (Multi-word Phrases containing the specified Keyword Term)
NT	Narrower Terms (also NT1=1st Level, NT2=2nd Level, etc.)
RT	Related Terms (see also)
USE	Use (Forbidden and preferred Terms)
UF	Used for (Preferred and forbidden Terms)

All these relationship codes may also be used with the SEARCH command to include a relevant set of associated terms with the thesaurus search term.

For a listing of the relationship codes online, type HELP RCODE at an arrow prompt.

The general format for using the thesaurus is shown below:

=> COMMAND TERM(S) + RELATIONSHIP CODE/PLE

where COMMAND is either EXPAND or SEARCH and RELATIONSHIP CODE is one of the codes from the table above, e.g.

```

=> E G1514+ALL/PLE
E#      FILE          FREQUENCY  TERM
---      ---          -
E1      WPIX          17797     BT1  G1503/PLE
E2      WPIX           0         Aldehydes - all references <polymer
formers>/PLE
E3      WPIX          2545     BT1  G1503-R/PLE
E4      WPIX           0         Aldehydes - general <polymer formers>/PLE
E5      WPIX           678     --> G1514/PLE
E6      WPIX           0         Aldehyde, other <polymer formers>/PLE
***** END *****

```

If you do an EXPAND on a term (code or text term) in the /PLE field without specifying a relationship code the thesaurus is not used and you will obtain an alphabetical listing around your desired term.

If you use the EXPAND command with one of the relationship codes you will obtain the appropriate listing of associated terms. Your expand term, if it is a thesaurus term (SELF Term), appears in the listing in its logical position and is marked by an arrow "→".

```

=> E CANS <APPLICATIONS>+BT/PLE
E#      FILE          FREQUENCY  TERM
---      ---          -
E1      WPIX           0         BT2  Packaging <applications>/PLE
E2      WPIX           0         BT1  Containers - all references
<applications>/PLE
E3      WPIX          58944     Q8399/PLE
E4      WPIX           0         BT1  Containers <applications>/PLE
E5      WPIX           0     --> Cans <applications>/PLE
E6      WPIX          2441     Q8457/PLE
***** END *****

=> E R01264+ALL/PLE
E#      FILE          FREQUENCY  TERM
---      ---          -
E1      WPIX          1912     --> R01264/PLE
E2      WPIX           0         Dicyanodiamide <chemicals>/PLE
E3      WPIX           0         Dicyanodiamide <polymer formers>/PLE
***** END *****

```

A SELF Term has to be entered in exactly the form in which it appears in the online thesaurus, otherwise a relationship cannot be carried out. Therefore it is recommended to use first the regular EXPAND (without relationship code) to verify the exact wording and to continue with an EXPAND or SEARCH plus relationship code.

```

=> E DIELECTRIC CONSTANT/PLE
E#   FILE           FREQUENCY      AT      TERM

                                UF Dissipation factor <properties>
                                UF Permittivity <properties>
                                UF Power factor <properties>

***** END *****

```

The **AUTO** relationship is often useful, because it includes automatically the preferred terms (**USE**) associated with a search term. The **AUTO** code is set **OFF** by default. To activate the **AUTO** relationship for all subsequent commands, enter **SET RELATION ON** at an arrow prompt. You may also set the relationship **ON** for a single command by including **RELATION ON** with your command. This is equivalent to: => **COMMAND TERM(S)+AUTO/PLE**.

```

=> E BY PRODUCTS/PLE 5
E#   FILE           FREQUENCY      AT      TERM
--   ----           -
E1   WPIX           0             5      BUTYROLACTONE <POLYMER FORMERS>/PLE
E2   WPIX           0             45     BY/PLE
E3   WPIX           0             -->    BY PRODUCTS/PLE
E4   WPIX           0             3      BY-PRODUCTS/PLE
E5   WPIX           0             3      BY-PRODUCTS <UNIVERSAL TERMS>/PLE

=> s e5+auto
L10   9459 "BY-PRODUCTS <UNIVERSAL TERMS>"+AUTO/PLE (3 TERMS)

```

Another useful relationship code is KT. The Keyword Term relationship identifies multi-word terms which contain the specified term.

```

=> E POLYOL+KT/PLE

Format

ANNN
 AN

Where: x = digit from 0 to 6
 ANNN = chemical fragmentation code
 AN = negation code

Fragmentation codes are searchable by eligible subscribers only. If you are an eligible subscriber you must apply to Thomson Reuters (Scientific) to have the correct access conditions applied to each STN LoginID.

Content

Thomson Reuters (Scientific) derived the chemical coding system in 1963, long before the arrival of more precise Markush graphical search systems (ca. 1987). Consequently, chemical code searching is the ONLY method of searching the widest disclosure of many chemical patents published between 1963 and 1987. In many cases, such patents will remain valid well past the year 2000, making chemical code searching an important element in any serious search effort involving chemical patents.

The chemical coding system (applicable to DWPI sections B, C, E) describes both single and Markush compounds found in patent specifications on the basis of the structural fragments found in these compounds. Thus, chemical code indexing is more traditionally known as "fragmentation coding". Fragmentation codes are assigned to disclosed applications and activities of the compounds being indexed, thus they provide an in-depth and comprehensive means of retrieving both structural and non-structural information relating to both specific and generic chemicals. It is possible for many compounds to be disclosed or claimed in one specification. For specific compounds, the fragments are separately displayed, i.e., one subfield per specific compound. For Markush structures, all the permutations of a core structure are placed in the same subfield. The subfields used for the fragmentation codes are listed below, along with the chemistry classes they are used to describe, and the years of availability.

The Fragmentation Codes are searched using the search qualifiers listed below:

Qualifier	Definition	Year
/Mo	Pre-1970 Non-steroid (sections B,C)	1963 – 1969 (B) 1965 – 1969 (C)
/M1	Natural Products and Polymers (sections B,C)	1970 onwards
/M2	General Chemicals (sections B,C)	1970 onwards
/M3	General Chemicals (section E)	1970 onwards
/M4	Dyes (section E)	1970 onwards
/M5	Steroids (sections B, C, E)	1963 onwards (B) 1965 onwards (C) 1970 onwards (E)
/M6	Galenical (section B)	1976 onwards

Chemical coding is initially assigned to records that have a basic from a major patent-issuing authority and for which an abstract is published. Basics from other authorities which do not have abstracts do not have the coding applied until the first appearance of an equivalent from one of the major patent-issuing authorities.

Search

Creating search strategies with chemical codes may seem fairly complex, since the searches are looking for chemical fragments that may exist in any of the myriad chemical variations covered by Markush specifications.

For a single record in the database, there is often more than one distinct Fragmentation Codes subfield. Codes of one subfield are linked by (P) proximity. You do not need to specify the (P) operator when searching in /M0, /M1, /M2, /M3, /M4, /M5, /M6 as implied (P) proximity is active in these fields. Use (NOTP) proximity to specify absence of the appropriate codes in a subfield.

The example below shows a simultaneous search of chemical codes in several /Mx search fields with implied (P) proximity operational.

Chemical codes that shall be searched in Boolean OR logic, have to be attached by (P) proximity (manually) to the query. Please note the correct use of parentheses, especially at the beginning and end of the query:

```
=> S (G040 H342 J431 J471 (P) (J521 OR J561) (P) J331 J581 J231)/M0
      36 G040 H342 J431 J471/M0
          ((G040(P)H342(P)J431(P)J471)/M0)
      366 J331 J581 J231/M0
          ((J331(P)J581(P)J231)/M0)

=> SET POS ON
SET COMMAND COMPLETED
```

Changes in the chemical codes over the years also tend to make chemical code searches seem more complex than other types of searches. To learn more about Chemical Code searching, consult the Chemical Indexing User Guide and the Chemical Code Guidelines user guide available from Thomson Reuters (Scientific).

Registry Compounds, Ring Index Numbers and Compound Numbers and Roles can also be searched in combination with the Chemical Codes. For more information, consult the Chemical Indexing User Guide.

A relatively simple and effective way for users to compile complex fragmentation coding search strategies is to use the front end software, "Markush TOPFRAG" (for TOPological FRAGMENTation code conversion). This program enables graphic chemical structures to be drawn on-screen. The program then generates the correct codes, putting them together with time ranging parameters to compile a strategy for input into STN. STN Express also contains a TOPFRAG module. As such searchers do not require Markush TOPFRAG.

Training is essential to use structure retrieval in online files, even with Markush TOPFRAG. Contact your nearest Thomson Reuters (Scientific) Technical Support Centre for advice. Thomson Reuters (Scientific) Search Services will also be pleased to handle searches for subscribers who do not yet have the necessary training.

The example below illustrates a search for captan in sections B, C and E from 1970 to date.

Derwent Registry Number

Qualifier

Search /DRN
 Display DRN
 Select DRN

Format

NNNN-A
 NNNN

Where: NNNN = four digit number
 A = role letter

The Registry Number field (/DRN) is searchable by eligible subscribers only. If you are an eligible subscriber, you must apply to Thomson Reuters (Scientific) to have the correct access conditions applied to each STN LoginID.

Content

About 2100 commonly occurring chemicals encountered in the claims and examples of patent specifications in DWPI sections B, C, and E have been indexed with unique Registry Numbers since 1981 (update 198127).

From 1984 (update 198401) the use of Registry Numbers was extended to cover DWPI sections A, D and H; and from update 198407, to the remaining chemical sections F, G, and J-M.

Section A (Plasdoc) has a separate list of Registry Numbers for about 750 compounds (or groups of compounds). Of these, approximately 350 are identical to those used in the other CPI sections and have the same numbers. The 400 additional section A compounds have been allocated numbers in the 5,000 series. These numbers in the 5,000 series were discontinued from update 199501 on the introduction of the Enhanced Polymer Indexing system.

The Registry Numbers are indexed with and without the following roles:

Role	Description
S	Starting Material or Reagent
U	Use (other than starting material or reagent)
P	Production of the Chemical

Registry Number Thesaurus

A thesaurus-like feature is available in the Registry Number field.

The following Relationship Codes can be used with the EXPAND and SEARCH commands:

Relationship Code	Description
ALL	All Associated Terms (SELF, USE, UF)
UF	Used for Terms (SELF, UF)
USE	Use Terms

For example:

```
=> e 1001+all/drn
E#   FILE           FREQUENCY      TERM
--   ----           -
E1   WPIX           267 --> 1001/DRN
E2   WPIX           UF   BENZALDEHYDE, 3,4-(METHYLENEDIOXY)/DRN
E3   WPIX           UF   BENZODIOXOLE-5-CARBOXALDEHYDE, 1,3-/DRN
E4   WPIX           UF   HELIOTROPIN/DRN
E5   WPIX           UF   PIPERONAL/DRN
E6   WPIX           UF   PIPERONYLALDEHYDE/DRN
***** END *****
```

Search

Registry Numbers are searchable with or without the role letter.

Since Registry Numbers are only applied to specific compounds in claims and examples, a search by Registry Number alone does not retrieve unspecified compounds contained within a Markush structure. Registry Numbers do, however, give retrieval of high relevance.

DCR numbers which have been autogenerated from the corresponding Registry Numbers are available in the Chemical Coding field.

Ring Index Number

Qualifiers

Search /RIN, /Mx (x = 0, 1, 2, 3, ..., 6)
Display CMC, RIN
Select RIN

Format

NNNNN

Where: NNNNN = five-digit ring code

Ring index numbers are searchable by eligible subscribers only. If you are an eligible subscriber, you must apply to Thomson Reuters (Scientific) to have the correct access conditions applied to each STN LoginID.

Content

Ring Index Numbers (RINs), available from 1972, are used to index specific ring systems that are not uniquely described by a chemical code. These numbers can be found in the "Patterson Ring Index" (2nd edition, and its supplements). Ring systems encountered in patent documents but not found in the "Patterson Ring Index" are assigned to RINs by Thomson Reuters (Scientific) numbering from 40,000 onwards.

Thomson Reuters (Scientific) has now stopped assigning new RINs (update 199901) but continues to apply existing RINs.

Although the "Patterson Ring Index" is used as a guide, not all of the Ring Index Numbers are used, since Thomson Reuters (Scientific) does not distinguish between levels of unsaturation or different tautomers.

In the same field "Rarer Fragment Numbers" are included. They were used during the period 1972-1975 to describe less common chemical fragments and were given numbers from 70,000 onwards.

Search

Ring Index Numbers should be used in conjunction with chemical codes and are linked by (P) proximity. Since update 198601, they have been specifically linked to the respective code subfield (Mo - M6). Furthermore, the RINs are displayed with the codes in their respective subfield.

For details about searching RINs with chemical codes, consult the Chemical Indexing User Guide.

Markush TOPFRAG

The most convenient way to look up RINs is to use the Markush TOPFRAG software, which allows graphical chemical structure drawing offline and automatic conversion of the structure(s) to a search strategy. RINs can also be identified using the TOPFRAG module of STN Express.

Display

Ring Index Numbers are part of the IND, CODE and MAX predefined display formats.

Derwent Markush and Specific Compound Numbers and Roles

Qualifiers

Search /DCN, /MCN, /Mx (x = 0, 1, 2, 3, ..., 6)
Display CMC, DCN, MCN (custom display only)
Select DCN, MCN

Format

Markush Compound Number

YYWW-CCCSS
YYWW-CCCSS-A

Specific Compound Number

RNNNNN
RNNNNN-A

Where: YY = Two-digit year
WW = Update number
CCC = Document identifier
SS = Number, 01-99, sequentially assigned
within a record
NNNNN = Five-digit serial number
A = Role letter

During 1999-2000, YYWW became a segmented serial number, rather than representing the year and update number.

Content

A Markush Compound Number is assigned to each structure from a patent that has been graphically indexed for the Merged Markush Service (MMS). Markush indexing began with update 198701 for pharmaceutical, agrochemical and general chemical compounds (Derwent sections B, C and E). The Markush Compound Number is normally given a single role qualifier to express the primary function of the compound(s) in the patent, but may have more than one role.

20,000 Specific Compound Numbers were compiled from 1987 to 1993 (update 199335) which then became a closed set of "common compounds".

The following roles are used with generic and specific compound numbers:

Roles	Description
A	Substance Analysed/Detected
C	Catalyst
D	Detecting Agent
E	Excipient
K	Known Compound
M	Component of a Mixture
N	New Compound
P	Known Compound Produced
Q	Product Defined in Terms of Starting Materials
R	Removing/Purifying Agent
S	Starting Material
T	Therapeutically Active
U	Use of a Single Compound
V	Reagent
X	Substance Removed
Z	Miscellaneous

Search

Compound Numbers are linked by (P) proximity to the relevant M1-M6 chemical codes with which they display, and can be directly searched in the Chemical Codes (/Mx) fields. (The Chemical Codes are discussed in more detail in the Chemical Indexing User Guide.)

```
=> S M411 9223-F8401/M3
L9          1 M411 9223-F8401/M3
           (M411 (P) 9223-F8401) /M3)
```

Chemistry Resource numbers which have been autogenerated from the corresponding Specific Compound Numbers are also linked by (P) proximity to the relevant M1-M6 chemical codes with which they display, and can be directly searched in the Chemical Codes (/Mx) fields.

Records that contain compound numbers have the entry "DCN" in field /FA (Field Availability).

Specific Compound Number Thesaurus

A thesaurus-like feature is available in the Specific Compound Number field. The following Relationship Codes can be used with the EXPAND and SEARCH commands.

Relationship Code	Description
ALL	All Associated Terms (SELF, USE, UF)
UF	Used for Terms (SELF, UF)
USE	Use Terms

For example:

```
=> E R20000+ALL/DCN
E#   FILE      FREQUENCY   TERM
---   -
E1   WPIX      17         -->R20000/DCN
E2   WPIX      UF         HYDROXY-2 (1H)-PYRIDINETHIONE -
                                     MAGNESIUM, 1-/DCN
E3   WPIX      UF         MAGNESIUM
                                     1-HYDROXY-2 (1H)-PYRIDINETHIONE/DCN
***** END *****
```

Display

Markush and Specific Compound Numbers display with the relevant M1-M6 chemical codes. Separate fields MCN and DCN are available for custom display. Compound numbers are part of the predefined display formats IND and MAX.

```

Chemistry Resource

The Chemistry Resource (DCR) is an index of specific structures designed to allow users to search the chemical content of Thomson Reuters (Scientific) online files. The indexing of chemical compounds was phased in by technology and by patent country during 1999. This structure searchable index allows efficient seamless access to the ongoing Derwent World Patents Index sections B, C and E, complementing the existing Fragmentation Code indexing and enabling both proficient and beginner chemical information searchers to obtain precise recall of information within their field of interest.

Chemistry Resource numbers are also available within the Enhanced Polymer Indexing field. These numbers have been autogenerated from the corresponding Specific Compound Numbers.

The Chemistry Resource number provides the unique identification label for specific chemical compounds and forms the seamless link between the Chemistry Resource and the corresponding bibliographic record in the Derwent World Patents Index.

The Chemistry Resource on STN also offers a useful text searching facility. These searchable fields include Systematic Name, Preferred Name and Molecular Weight.

The online Chemistry Resource record for Nandrolone

DCR Numbers provide the link to Derwent World Patents Index

Searchable text fields include:
 Systematic Name, Preferred
 Name and Molecular Weight

Searchable chemical structures

The Chemistry Resource on STN shares the same searching features as all the other STN structure searchable databases, including the substructure, family, exact and structure subset search options and is available to both subscribers and non-subscribers within WPINDEX, WPIDS and WPIX.

Unique software functionality allows a search crossover between the Chemistry Resource and Derwent World Patents Index from within a single file label (WPIX/WPIDS/WPINDEX).

Detailed information on searching the Chemistry Resource can be found in the

Chemistry Resource on STN user guide at www.stn-international.de/training_center/patents/dcr_rm.pdf.

Workshop material at www.stn-international.de/training_center/patents/DCR_o2o8.pdf

Search fields in the bibliographic part of DWPI which relate to Chemistry Resource indexing are detailed below:

DWPI Search Field	Definition
DCN	Derwent Compound Number, Specific Compound Number
MCN	Derwent Compound Number, Markush Compound Number
DCR	Chemistry Resource Accession Number, Bibliographic Segment
DRN	Derwent Registry Number
IT (KW)	Index term (including Chemistry Resource numbers)
Mo-M6	Chemical Codes (including Derwent Chemistry Resource numbers)
PLE	Enhanced Polymer Indexing (including Chemistry Resource numbers)
RIN	Ring Index Number
UPA	Update Date Polymer Indexing
UPB	Update Date Chemical Code
UPIT (UPKW)	Update Date Index Terms (Keyword Indexing)

Chemistry Resource numbers are available within the Index Term (Keyword Indexing), Chemical Codes and Enhanced Polymer Indexing fields. Chemistry Resource numbers within the Enhanced Polymer Indexing field have been auto-generated from the corresponding Specific Compound Numbers. In addition Chemistry Resource numbers have also been auto-generated from the Specific Compound Numbers and Registry Numbers available within the Chemical Coding fields.

Available DCR Search fields are:

DCR Search Field	Definition
AN.S	Chemistry Resource Accession Number, Chemistry Resource Segment
CC	Classification Code (Substance Descriptor)
CMF (FRACMF)	Component Molecular Formula
CMT	Comment
CN	Chemical Name
CN.P	Chemical Name, Preferred
CN.S	Chemical Name, Systematic
CNS	Chemical Name Segment (from CN.P, CN.S, SY)
CT	Controlled Term
CT.DA	Controlled Term, Drug Activity
CT.MA	Controlled Term, Mechanism
DCRN	Derwent Crop Protection Registry Name
DCSE	Chemistry Resource Number, Chemistry Resource Segment
DDRN	Derwent Drug Registry Name
EDCR	Entry Date Chemistry Resource
ELS	Element Symbol
ELS.CNT	Element Symbol, Count
FRAGMF (CMF)	Fragment Molecular Formula
FRAGMF.CNT (CMF.CNT)	Fragment Molecular Formula, Count
MF	Molecular Formula
MW	Molecular Weight
NC	Number of Components
NFRAG	Number of Fragments
SCR (SXR)	Structure Cross Reference
SDCN	Structure Segment Derwent Compound Number
SDRN	Structure Segment Derwent Registry Number
SMF	Standardized Molecular Formula
SRIN	Structure Segment Ring Index Number
SY	Synonym Name
UPCR	Update Date Chemistry Resource
UPWX	Update Date DWPI Cross Reference

UPCR is created when new compounds enter the Chemistry Resource segment. UPWX is created when Chemistry Resource compounds are cited in the bibliographic records. UPWX is used in automatic current searches (SDIs) in the DCR file segment.

There are two display formats available from within the bibliographic part of the DWPI which display the chemical compounds having led to the retrieval of these documents after a structure (or fragment code) search and subsequent crossover.

HITSTRucture	Displays the DCR hit record which led to the retrieval of the bibliographic record.
FRAGHITSTRucture	Displays the DCR record which corresponds to the chemical coding (including DCRs, DCNs, RINs etc.) which led to the retrieval of the bibliographic record.

Content

Update codes are assigned to all records to indicate when a new record is added to the database or when information is added to an existing record. The minimum granularity for the data is the logical unit.

Generally all logical units have an update date attached, although not all are listed below for clarity.

Files WPINDEX/WPIDS/WPIX are updated approximately every three to four days and records may include all of the update codes. The latest update status is displayed in the DWPI banner message.

Entry Date or Basic Update (/ED)

All new documents – mostly basics - added to DWPI receive a 'time stamp' to indicate the date they were added to the file. Use the /ED field code to restrict a search to new inventions only.

```

Basic and Equivalents Update (/UPP)

All family members have an update date (UPP) assigned to indicate the date they were added to the file. This includes the initial creation of the record. A basic will therefore be attributed both an ED and an UPP update date. Subsequent equivalents are then given additional UPP update dates.

In order to be able to provide some 'history' of the patent family from the old DWPI file, the initial set of UPP data had been transferred from the old DWPI database as far as possible until regular updates commenced. From update 200610 onwards /UPP has been populated with 'real' family update dates for DWPI.

Equivalents Update (/UPEQ)

The Equivalents Update Date UPEQ is written whenever an equivalent is added to the family.

Abstract Update (/UPAB)

The Abstract Update code UPAB is written when the basic abstract or equivalent abstracts are added to a record. They display in the headlines of the AB or ABEQ fields next to the patent number the abstract derives from.

Section A Polymer Indexing Update (/UPA)

The Section A update date UPA is assigned to records that have had new Section A fragmentation codes and key serial numbers or Enhanced Polymer Indexing data added to them. Use the /UPA field to restrict a Section A coding search to the latest references.

Chemical Code or Section B, C, E Coding Update (/UPB)

The Chemical Indexing update date UPB is added to records that have had new B, C, E (Mo - M6) Fragmentation Codes assigned to them.

Graphic Image Update (/UPGI)

The Graphic Image update date UPGI is added to records that have had a new image assigned to them.

Patent Assignee Update (/UPPA)

The Patent Assignee update date UPPA is written whenever patent assignee information is added to a record.

Priority Information Update (/UPPR)

The Priority Information update date UPPR is added to records whenever additional priority information is assigned to them.

Enhanced Title Update (/UPTI)

The Enhanced Title update code UPTI is assigned to records whenever the Thomson Reuters (Scientific) value-add title is generated or updated. This may be particularly useful for tracking Equivalents-Treated-As-Basic records where the initial title from the minor country is replaced by a title from the major country equivalent.

Index Terms Update (/UPIT, /UPKW)

The Index Terms update date UPIT (UPKW) is added to a document whenever Chemistry Resource indexing numbers are assigned to it.

General Update Date (/UP)

If a new record is created or an existing one is updated, i.e. if any of the update dates described above are generated, an entry in the Update Date (/UP) field is also generated.

The latest update date is displayed in the DWPI banner message.

Chemical Resource Update (/UPCR, /UPWX) and Entry Date (/EDCR)

Additional update dates from the Chemistry Resource segment are UPCR/EDCR (Update Date/Entry Date Chemistry Resource) and UPWX (Update Date DWPI Cross Reference) which are assigned to the Chemistry Resource structure records rather than the bibliographic records.

An entry in /UPCR and /EDCR is created when new compounds enter the Chemistry Resource segment, /UPCR only when structures are corrected. An entry in /UPWX is created when Chemistry Resource compounds are cited in bibliographic records. UPWX is used in SDIs in the Chemistry Resource segment.

Search

The Entry Date field and all the Update fields are searched using the formats YYMMDD or YYYYMMDD or one of the other STN Date Edit formats. The YYYYMMDD format is indexed and available in expand lists. The Entry Date field and the Update fields are range searchable.

Individual Patent Publication Data

Apart from the invention documents described above the database also contains patent publication records which allow users to search and display bibliographic data and general indexing information associated with individual documents that make up the patent family (invention). Additional data elements are also provided for individual publications such as original titles and abstracts, claims, addresses and agent information.

The Invention Level or Patent Family is the traditional view of the data within Derwent World Patents Index meaning that no additional search or display qualifiers are required.

Data elements common between the Invention and Patent Publication Levels, such as Patent Assignees, have the same search qualifiers. To restrict searches to

the Patent Publication Level field only requires the use of (L) proximity with the document level indicator + qualifier -> PUBLICATION/DLVL.

Each individual patent publication record constitutes a single unit of information linked by (L) proximity. This means that searches can be confined to the realm of a patent publication record by use of a link proximity operator and the said document level indicator. Likewise exclusion of certain terms from the realm of an individual publication can be accomplished with (notL) proximity operator.

For example we wish to retrieve the following record which comprises two patent publications each with an original English Title (TIEN) by searching for “oil” and “degreasing”:

```
L2 ANSWER 1 OF 1 WPIX COPYRIGHT 2011 THOMSON REUTERS on STN
AN 1993-312890 [199340] WPIX

Member(0001)
TIEN Method and apparatus for removing oil from articles

Member(0002)
TIEN DEGREASING METHOD AND DEVICE
```

The following search would not yield the document above as although we are stipulating both “oil” and “degreasing” within TIEN, according to this search these terms have to be within the TIEN of a single member patent whilst in our example “oil” is in Member(0001) and “degreasing” is in Member(0002)

```
=> s OIL/TIEN(L)DEGREASING/TIEN AND 1993-312890/AN
      46970 OIL/TIEN
      593 DEGREASING/TIEN
      11 OIL/TIEN(L)DEGREASING/TIEN
      1 1993-312890/AN
L1 0 OIL/TIEN(L)DEGREASING/TIEN AND 1993-312890/AN
```

compared to the following search which does retrieve the document as we have substituted “articles” for “degreasing” so that both search terms are within the same member patent TIEN, Member (0001):

```
=> S OIL/TIEN(L)ARTICLES/TIEN AND 1993-312890/AN
      46970 OIL/TIEN
      23231 ARTICLES/TIEN
      25 OIL/TIEN(L)ARTICLES/TIEN
      1 1993-312890/AN
L2      1 OIL/TIEN(L)ARTICLES/TIEN AND 1993-312890/AN
```

Employing a Boolean AND for the search for “oil” and “degreasing” would retrieve the document of course:

```
=> S OIL/TIEN AND DEGREASING/TIEN AND 1993-312890/AN
      46970 OIL/TIEN
      593 DEGREASING/TIEN
      1 1993-312890/AN
L2      1 OIL/TIEN AND DEGREASING/TIEN AND 1993-312890/AN
```

Potentially any field present at the Invention Level may be present at the Patent Publication Level (e.g. the patent assignee field), apart from the chemical and polymer coding and indexing fields. Additional data elements which are unique to the Patent Publication Level (e.g. original author abstracts) are described in more detail in the following chapters.

Original Titles, Abstracts and claims

Basic Index Extension

Qualifiers

Search	/BIEX
Display	TIDE, TIEN, TIES, TIFR, ABDE, ABEN, ABES, ABFR, ABOL, CLM, CLMDE, CLMEN, CLMFR
Select	TIDE, TIEN, TIES, TIFR, ABDE, ABEN, ABFR, ABES, ABOL, CLM, CLMDE, CLMEN, CLMFR

Content

The Basic Index Extension conveniently gathers all subject words from the first level text fields additionally provided at the Patent Publication Level into one category and permits general subject searching without the necessity of using search qualifiers. It contains single words from the following alphanumeric fields:

Subject Word	Field Label	Definition
Title (German)	TIDE	all words from the original title (German language)
Title (English)	TIEN	all words from the original title (English language)
Title (French)	TIFR	all words from the original title (French language)
Title (Spanish)	TIES	all words from the original title (Spanish language)
Abstract (German)	ABDE	all words from the original abstract (German language)
Abstract (English)	ABEN	all words from the original abstract (English language)
Abstract (Spanish)	ABES	all words from the original abstract (Spanish language)
Abstract (French)	ABFR	all words from the original abstract (French language)
Abstract (other language)	ABOL	all words from the original abstract (other language)
Claims (German)	CLMDE	all words from the original first Claim (German language)
Claims (English)	CLMEN	all words from the original first Claim (English language)
Claims (French)	CLMFR	all words from the original first Claim (French language)

The Basic Index Extension contains single words from the fields above without punctuation.

Search

As the Basic Index Extension is not the default search field the /BIE suffix must be used in all EXPAND and SEARCH commands otherwise the search will default to the standard Basic Index covering the value-added text data. Word proximity is implied if no other Boolean or proximity operator is being provided.

ABEN Histone deacetylase is a metallo-enzyme with zinc at the active site. Compounds having a zinc-binding moiety, such as, for example, a hydroxamic acid group or a carboxylic acid group, can inhibit histone deacetylase. Histone deacetylase inhibition can repress gene expression, including expression of genes related to tumor suppression. Accordingly, inhibition of histone deacetylase can provide an alternate route for treating cancer, hematological disorders, e.g., hemoglobinopathies, genetic disorders, e.g. Huntington's disease and spinal muscular atrophy and genetic related metabolic disorders, e.g., cystic fibrosis and adrenoleukodystrophy.

ABFR Selon cette invention, l'histone desacetylase est une metallo-enzyme comprenant du zinc au niveau du site actif. Des composés comprenant un groupe de liaison au zinc, tel qu'un groupe acide hydroxamique ou un groupe acide carboxylique, peuvent inhiber l'histone desacetylase. L'inhibition de l'histone desacetylase peut reprimer l'expression génique, y compris l'expression de gènes associés à la suppression de tumeurs. Ainsi, l'inhibition de l'histone desacetylase peut offrir une alternative pour le traitement du cancer, de troubles hématologiques tels que les hémodépressions, de troubles génétiques tels que la maladie de Huntington et l'amyotrophie spinale, ainsi que de troubles métaboliques génétiques tels que la fibrose kystique et la adrenoleucodystrophie.

 oder nicht substituierte Phenylgruppe (-C₆H₅) oder eine substituierte
 oder nicht substituierte gesaettigte oder ungesaettigte aliphatische
 Gruppe mit 1 bis 30 C-Atomen ist, und R₂ eine substituierte oder nicht
 substituierte, gesaettigte oder ungesaettigte aliphatische Gruppe mit 1
 bis 30 C-Atomen oder eine substituierte oder nicht substituierte
 aromatische Gruppe oder eine substituierte oder nicht substituierte
 araliphatische Gruppe ist, wobei saemtliche der genannten Gruppen
 gegebenenfalls ein oder mehrere Heteroatome aus der Gruppe umfassend
 Stickstoff, Sauerstoff, Schwefel, Phosphor in ihrer Kette umfassen und,
 falls ein Substituent vorhanden ist, dieser ausgewaehlt ist aus der
 Gruppe -OH; -OR₃; -SR₄; -NR₅; -NH(CO)R₆; -(C=O)OR₇; -(C=O)R₈;
 -(C=NR₉)R₁₀; -(C=S)NR₁₁; -CN; -(C=S)R₁₂; -(C=O)SR₁₃; -(C=N)R₁₄;
 -(C=O)NR₁₅R₁₆, und einer weiteren Phosphinsauregruppe mit dem
 Strukturelement -P(O)(OH)-R₂₃, wobei R₃, R₄, R₅, R₆, R₇, R₈, R₉, R₁₀,
 R₁₁, R₁₂, R₁₃, R₁₄, R₁₅ und R₁₆ unabhangig voneinander gleich oder
 verschieden sind und H, substituiertes oder nicht substituiertes C₁- bis
 C₆-Alkyl, oder substituiertes oder nicht substituiertes Aryl darstellen,
 wobei R₂₃ unabhangig die gleiche Bedeutung wie R₁ oder R₂ hat, und/oder ein
 Salz davon,(D) optional ein oder mehrere Loesemittel, sowie(3)
 thermisches und/oder photochemisches und/oder atmosphaerisches Vernetzen
 der vernetzbaren Zubereitung.

Original author abstracts in German, English and French may be available for patent publications. This data may be available for the following documents:

- German applications, granted patents and utility models (DE-A1, DE-B1/B2/B3/B4, DE-C1/C2 and DE-U1) since 2000
- European applications and granted patents (EP-A1/A2, EP-B1/B2) since 1978 for applications filed in English and since 2000 for applications filed in German or French
- US applications and granted patents (US-A, US-A1, US-B1/B2) since 1975
- PCT applications (WO-A1/A2) since 1978
- Chinese patents and utility models (China Utility Models since November 2007 and Taiwanese Utility Models since 2008)
- Japanese applications, granted patents and utility models since 2008 (200824)
- Korean patents and utility models since 200849
- Russian granted patents since 2009
- Russian published applications since 2010 (Machine Assisted Translation)
- France published applications since 2009
- Brazil (A2, B1, E2, F1, U2, Y1) since 2010 (Portuguese)
- Spain (A,A1,A2,A6,B,B1,B2, T1,T2,T3,T4,5,T6,U) since 2010 (Spanish)

- India (I1-4) since 2009
- Chinese applications, granted patents and utility models since June 2007 (Human Translation)
- South Korea (A, B, U, Y1) since 2008 (Machine Translation)
- Malaysia (A, A1) since 2010
- Vietnam granted patents (B) since 2010 (Human Translation)
- Thailand granted patents (A) since 2010 (Human Translation)

Sometimes language indicators for other languages are given. These abstracts can be searched for in the fields /ABES and /ABOL (Author Abstract, other languages). These may still be in English language due to erroneous language indicators, e.g. for machine aided translation abstracts.

Search

Original patent publication abstracts are indexed in the language-specific individual search fields/ABxx or the Extended Basic Index /BIEX. Please note that /AB only contains the value-added abstract (excluding Documentation /ABDT and Extension Abstracts /ABEX). Word proximity is implied if no other operator is given.

Display

German, English, French, Spanish and other language abstracts can be displayed with ABDE, ABEN, ABES, ABFR and ABOL respectively, irrespective of whether they are sourced from German, European or PCT documents. All English language original abstracts are displayable with ABEN.

An illuminated sign includes a plurality of sections. Each section includes a mesh of conductors having illuminating pixels located at conductor intersections. The mesh is surrounded by a frame connected to the frame of another section. Once frame sections of the display are unfolded, the display can be supported by a structure attached to a car or other vehicle. A support structure for an illuminated display includes a base which is placed on the ground and over which the tire of a vehicle (e.g., a police car) is parked. A column extends from the base, and a display can be attached to the top of that extending column. The support structure can take the form of a collapsible stand having a trunk which is pivotally attached to a base and which contains a telescoping section.

L7 ANSWER 1 OF 1 WPIX COPYRIGHT 2011 THOMSON REUTERS on STN

Member(0001)

ABFR WO 2005090686 A2 UPA 20051223

Un panneau de signalisation lumineux comporte une pluralite de sections. Chaque section comporte un reseau de conducteurs pourvus de pixels lumineux situes au niveau d'intersections entre des conducteurs. Ce reseau est entoure par un cadre relie au cadre d'une autre section. Une fois les sections de l'affichage deployees, cet affichage peut etre supporte par une structure fixee sur une voiture ou tout autre vehicule. Une structure de support pour un affichage lumineux comporte un socle place au sol et sur lequel le pneu d'un vehicule (p. ex. une voiture de police) est gare. Une colonne s'etend du socle et un affichage peut etre fixe en haut de ladite colonne. Cette structure de support peut prendre la forme d'un pied repliable pourvu d'une tige fixee au socle, de facon a pouvoir pivoter, et contenant une section telescopique.

CLMEN CN 201118824 Y UPCL 20081030

[CLAIM 1] A video conference device at least comprises a main body; at least three foot rests, one end of each of which is articulated around the main body; and a post body extended outwards from the middle of the main body.

[CLAIM 2] The video conference device according to claim 1, wherein the main body is a round disk body.

[CLAIM 3] The video conference device according to claim 1, wherein the post body has a light-emitting diode.

[CLAIM 4] The video conference device according to claim 1, wherein it also comprises a liquid crystal display screen located on the main body.

[CLAIM 5] The video conference device according to claim 1, wherein it also comprises a loud speaker located on the post body.

[CLAIM 6] The video conference device according to claim 1, wherein it also comprises a loud speaker located on the main body.

[CLAIM 7] The video conference device according to claim 1, wherein the post body is vertical to the main body.

[CLAIM 8] The video conference device according to claim 1, wherein it also comprises pedestal with the same number as said foot rest, each pedestal is articulated at the other end of each corresponding foot rest.

[CLAIM 9] The video conference device according to claim 1, wherein it also comprises a microphone set on the main body.

[CLAIM 10] The video conference device according to claim 8, wherein it also comprises a microphone set on the pedestal.

[CLAIM 11] A video conference device at least comprises: a main body with multiple key-presses; at least three foot rests, one end of each of which is articulated around the main body; a post body extended outwards from the middle of the main body; and a shooting device articulated at the top end of the post body in a rotating way.

[CLAIM 12] The video conference device according to claim 11, wherein the main body is a round disk body.

[CLAIM 13] The video conference device according to claim 11, wherein the post body has a light-emitting diode.

[CLAIM 14] The video conference device according to claim 11, wherein it also comprises a liquid crystal display screen located on the main body.

[CLAIM 15] The video conference device according to claim 11, wherein it also comprises a loud speaker located on the post body.

[CLAIM 16] The video conference device according to claim 11, wherein it also comprises a loud speaker located on the main body.

[CLAIM 17] The video conference device according to claim 11, wherein the post body is vertical to the main body.

[CLAIM 18] The video conference device according to claim 11, wherein it also comprises pedestal with the same number as said foot rest, each pedestal is articulated at the other end of each corresponding foot rest.

[CLAIM 19] The video conference device according to claim 11, wherein it also comprises a microphone set on the main body.

[CLAIM 20] The video conference device according to claim 18, wherein it also comprises a microphone set on the pedestal.

Format

The language of the title, abstract and/or claims at the patent publication level is indexed under /SL.M as either the two letter country code or in full. This allows searches to be restricted to certain languages if required. Some records may contain a combination of English, German and/or French language data. In such cases all applicable languages have been indexed under /SL.M.

Content

The language of the title, abstract and/claims at the Patent Publication Level can be a combination of English, German and/or French depending on the data source.

Original titles:

may be present in German for:

- German applications, granted patents and utility models (DE-A1, DE-B1/B2/B3/B4, DE-C1/C2 and DE-U1) since 1968
- European applications and granted patents (EP-A1/A2, EP-B1/B2) since 1978
- PCT applications (WO-A1/A2) since 1978

May be present in French for:

- European applications and granted patents (EP-A1/A2, EP-B1/B2) since 1978
- PCT applications (WO-A1/A2) since 1978

May be present in Spanish for:

- PCT applications (WO-A1/A2)

AN      1996-402370 [199640]   WPIX
AB      WO 1996026279 A1      UPAB: 20050513
An actin-resistant human DNase I variant is new. Also claimed is an
isolated nucleic acid encoding a human DNase I actin-resistant variant.
USE - The actin-resistant DNase I variants are used to treat a
pulmonary disease or disorder especially cystic fibrosis or chronic bronchitis
(claimed). They can be used for reducing the viscoelasticity or viscous
consistency of DNA-containing material in a patient. They can be used for
treating e.g. acute or chronic bronchial pulmonary disease, asthma,
systemic lupus erythematosus. They can also be used in in vitro diagnostic
assays of a viscous material from a patient to measure the amount of actin
present and determine whether the patient is an appropriate candidate for
treatment with an actin-resistant DNase I variant.
ADVANTAGE - Because the variants have reduced affinity for actin,
their DNA hydrolytic activity is less inhibited in the presence of actin
and so these variants have greater mucolytic activity in the presence of
actin as compared to native human DNase I.

ABEQ    (0013)
US      20010041360 A1      UPAB 20050513
NOVELTY - Human DNase I actin-resistant variants and the nucleic acids
that encode them, are new.
DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the
following:
(1) a human DNase I actin-resistant variant (I);
(2) a variant (Ia) of (I) that has binding affinity for actin that
is at least 5 fold less than that of native human DNase I;
(3) a variant (Ib) comprising an amino acid sequence with at least
90% identity to the defined amino acid sequence (A) of human DNase I;
(4) a human DNase I actin-resistant variant (Id) comprising an
amino acid sequence that differs from (A) by the substitution of 1 amino
acid for another at 1 or 2 positions within (A);
(5) a nucleic acid (II) encoding the human DNase I variants
(Ia)-(Id);
(6) a method (III) for the treatment of a patient with a pulmonary
disease or disorder comprising administering (I); and
(7) a composition (IV) comprising the actin-resistant variants of
human DNase I.
ACTIVITY - Respiratory; mucolytic; antiasthmatic; dermatological;
immunosuppressant; antiinflammatory. A sputum compaction assay (see
Patent Number WO9410567 (1994)) was used to measure the relative
viscoelasticity of sputum from cystic fibrosis patients (CF sputum) before
and after incubation with native human DNase I and different DNase I
variants. After mixing CF sputum with a DNase I sample and incubating for
20 minutes (min) at room temperature, the semi-solid solutions were loaded
into capillary tubes, which then were centrifuged at 12000 rpm for 20 min.
Following centrifugation, the height of the pellet was measured and
compared to the height of the solution plus pellet. These measurements
were then used to calculate the percent compaction of the sputum, which
correlates with the viscoelasticity of the sputum. The percent compaction
determined upon treatment of CF sputum with native human DNase I and human
DNase I actin-resistant variants indicated that the human DNase I
actin-resistant variants are more effective than native human DNase I in
reducing the viscoelasticity of CF sputum, as determined by the compaction
assay.
MECHANISM OF ACTION - None given in the source material.
USE - The human DNase I actin-resistant variants are used (via

Inventor full, original names (/INO) have been indexed as bound phrases including punctuation (Surname First Name) and single words.

Inventor addresses (/INA) have been indexed as bound phrases and single words. However the inventor country (/INA.CNY) and inventor city (/INA.CTY) have also been indexed separately where it has been possible to isolate this information from the original data. Inventor nationality and residence have been indexed in /IN.NAT and /IN.RES.

The Inventor Total index (/IN.T) contains both inventor full names and addresses indexed as bound phrases and single words. Where it has not been possible to

identify component parts of an inventor full name and/or address to populate /INO and /INA respectively then this information will only be present in /IN.T.

Due to the wide variation in formatting and punctuation of original inventor full names and addresses in original author data it is useful to expand the appropriate index to ensure that all relevant data is considered.

Content

Inventor full names and associated address information may be available for the following documents:

- German applications, granted patents and utility models (DE-A1, DE-B1/B2/B3/B4, DE-C1/C2 and DE-U1) since 1968
- European applications and granted patents (EP-A1/A2, EP-B1/B2) since 1978
- US applications and granted patents (US-A, US-A1, US-B1/B2) since 1975
- PCT applications (WO-A1/A2) since 1978
- Japanese applications, (JP-A) since 1977 (no address information)

ABEN A dock leveler sealing system that includes a barrier configured to be attached to a dock leveler and a hinged region located in the barrier and configured to facilitate one portion of the barrier moving with respect to a second portion of the barrier. The dock leveler sealing system also includes a biasing apparatus attached to the barrier and configured to position the first portion of the barrier at a bias relative to the second portion of the barrier. Also, a method of providing a seal between a loading dock and an area outside of the loading dock.

CLMEN What is claimed is: 1 . A dock leveler sealing system, comprising: a barrier configured to be attached to a dock leveler; a hinged region located in the barrier and configured to facilitate one portion of the barrier moving with respect to a second portion of the barrier; and a biasing apparatus attached to the barrier and configured to position the first portion of the barrier at a bias relative to the second portion of the barrier.

Format

Original patent assignees (/PAO) have been indexed as bound phrases and single words. /PAO is the non-standardised version of the patent assignee as appearing on the patent document. The Thomson Reuters (Scientific) standardised version of the patent assignee is indexed under /PA.

/PAO is not updated with any subsequent changes in ownership of the invention and so merely reflects the information present on the document at the time of publication.

Original patent assignee addresses (/PAA) have been indexed as bound phrases and single words. However the patent assignee country (/PAA.CNY) and patent assignee city (/PAA.CTY) have also been indexed separately where it has been possible to isolate this information from the original data.

The Original Patent Assignee Total index (/PA.T) contains both patent assignee and associated address indexed as bound phrases and single words. Where it has not been possible to identify component parts of the patent assignee and/or address to populate /PAO and /PAA respectively then this information will only be present in /PA.T.

Due to the wide variation in formatting and punctuation of patent assignees and addresses in original author data it is useful to expand the appropriate index to ensure that all relevant data is considered.

When creating the standardized version of the patent assignee, /PA, Thomson Reuters (Scientific) does not take into account any country specific limitations on the assignees. This information is, however, present as part of the individual patent publication section and can be searched using the patent assignee limitation index (/PA.LIM) index. Patent assignee residence (/PA.RES) and patent assignee nationality (/PA.NAT) information may also be available.

Content

Original patent assignees and associated address information may be available for the following documents:

- German applications, granted patents and utility models (DE-A1, DE-B1/B2/B3/B4, DE-C1/C2 and DE-U1) since 1968
- European applications and granted patents (EP-A1/A2, EP-B1/B2) since 1978
- US applications and granted patents (US-A, US-A1, US-B1/B2) since 1975
- PCT applications (WO-A1/A2) since 1978
- Japanese applications, (JP-A) since 1977 (no address information)

TEXA-C) UNIV TEXAS SYSTEM is the Thomson Reuters (Scientific) standardized patent assignee. This appeared on the original PCT document as BOARD OF REGENTS OF THE UNIVERSITY OF TEXAS SYSTEM as shown by the PAO field.

The above example also illustrates the presence of the Patent Assignee Limitation, Residence and Nationality information.

In this case UNIV TEXAS SYSTEM is qualified on the original document as being the patent assignee for all

authorities except the US. For the US the individuals are considered to be the assignees. As this limitation is not taken into account when preparing the Thomson Reuters (Scientific) standardized PA field, there is no PA equivalent for these assignees.

The EP document of the family does not however have any country limitations on the patent assignees so there are standardized versions (UNIV TEXAS SYSTEM and DARTMOUTH COLLEGE) of both original patent assignees.

Patent agent and address (AG and AGA) also form part of the Member (MEMB) and Member Full (MEMBF) display formats. AG.T is also available in the Member Brief (MEMBB) format.

Classifications

Issued US National Classification

Qualifiers

Search /INCL, /INCLM, /INCLS
 Display INCL
 Select INCL, INCLM, INCLS

Format

Both the Main and Secondary Original (Initial) US national classes are indexed in the INCL field. Searches can be restricted to the Main or Secondary Original (Initial) US national class using the separate INCLM or INCLS fields respectively.

Each US national class is indexed at the 3, 9 and 12-character level to avoid the need to use extensive truncation in generic searches. All classifications are indexed without any delimiters.

Content

Original (Initial) US national classes as issued on the US document at the time of publication are available for:

- US applications and granted patents (US-A, US-A1, US-B1/B2) since 1975

Search

Original US national classes are associated with the patent publication.

International Patent Classification

There is additional IPC data available for the individual publications namely the original classifications lifted from the document and additional details for IPC Reform classifications in general.

Current International Patent Classification (Versions 1-7)

Qualifiers

The set of qualifiers is the same as for the collated and deduplicated set of IPCs for the invention.

Content

The current IPCs pertaining to individual patent publications may be available for the patent publications for each constituent family member. These sets can be different from the collated and deduplicated set of IPCs pertaining to the entire invention, e.g. 'linked' ICI codes.

Initial International Patent Classification (Versions 1-7)

Qualifiers

Editions 1-7 Original (Initial) IPC search fields:

STN Search Qualifier	Content
/IIC	IPC, Main and Secondary, Initial
/IICM	IPC, Main, Initial
/IICS	IPC, Secondary, Initial
/IICA	IPC, Additional (Supplementary), Initial
/IICI	IPC, Index (Complementary), Initial
/MGR	IPC, Main Group Range Searchable
/SGR	IPC, Subgroup Range Searchable

Content

Original IPCs as published on the patent document may be available for the patent publications for each constituent family member (subject to the historical availability of IPCs as outlined below). These can be different from the collated and deduplicated set of IPCs pertaining to the entire invention, e.g. 'linked' ICI codes.

Search

The general IPC indexing and search methodology have already been outlined in the chapter for the invention IPCs already, the main difference for the original classifications in the individual publications for IPC versions 1-7 is the different set of fields set aside for these codes. The field codes begin with an 'I' to indicate 'Initial'.

The Original (Initial) Main IPC of the Basic Patent can conveniently be searched using /IICM in combination with the keyword 'BASIC' (e.g. /IICM(S)BASIC/IPC.KW).

```
=> s a61k/IICM(S)BASIC/IPC.KW
    249868 A61K/IICM
    16967905 BASIC/IPC.KW

IPC Reform Classification

Qualifiers

Search	/IPC.REF, /IPC, /IPC.KW, /IPC.VER, /IPC.ACD
Display	IPCI, IPCR
Select	IPC, IPC.F, IPC.REF, IPCI, IPCR, IPC.A, IPC.C, IPC.CI, IPC.AI
Sort	IPC.F

Content

If available at the Patent Publication Level, IPCI and IPCR contain the Current and Original (Initial) IPC Reform codes for constituent member patents. The codes are associated with all attributes available. STN splits the IPC Reform codes supplied at the Patent Publication Level into two display fields, IPCI and IPCR, dependent on the level attribute of the IPC. There are no separate indices for Current and Original (Initial) IPC Reform codes, but these can be distinguished between using the level attribute. IPCI contains IPCs with a level attribute of B (Original/Initial Classification). IPCR contains IPCs with a level attribute of R (Reclassification), D (Deletion) or V (Correction).

IPCI and IPCR are display fields only. In the display current and original IPCs are prefixed with 'Current:' and 'Original:'

Search

Searching for IPC Reform codes in an individual patent publication is not different from the procedure employed for the invention codes – unless one wants to confine the query to the realm of an individual patent publication, but there are more attribute values available for searching. Attributes pertaining to an IPC code are searchable by using keywords or attribute codes in the IPC keyword field linked with (S) proximity to the IPC code. For the version date and the action date the numerical search fields /IPC.VER and /IPC.ACD apply.

All available attributes are present at the Patent Publication Level:

Attribute	Code	Definition
Version Indicator	YYYYMMDD	IPC version date
Class Level	A	Advanced level
	C	Core level
	S	Subclass level
Position	F	First invention information
	L	Later invention information
Scope	I	Inventive
	N	Non-Inventive/Additional
Action Date	YYYYMMDD	Date the IPC code was applied
Level	B	Original Classification
	R	Reclassification
	V	Modified/Corrected
	D	Deleted
Applied	H	Intellectual Classification
	M	Machine Propagation across a family
	G	Automatic Generation
Office	CC	The country or office code that delivered the classification

Note: when searching attributes the level attribute "B" has been indexed as "O" and not "B" to avoid any confusion with "Basic".

Search examples:

```

Display

For display purposes the tabular display format `ipc.tab.m` is being provided which shows all IPC information available – including all attributes – in a tabular format. The standard display for the IPCs - with the reduced set of attributes - pertaining to the individual patent publications is incorporated in the MEMB and MEMBF display formats.

Application and Priority Details

Content

Application and Priority Application numbers are available associated with the individual patent publications they pertain to rather than the 'pooled' set of priority application data for the invention. This potentially leads to more selective searches if this is required, but these refinements need to be administered with care.

For example, the sets of application and priority application numbers pertaining to the invention are not

merely a collation of the numbers lifted from the individual patent publications. In order to increase recall certain application numbers from the individual publications, e.g. national application numbers, have been copied to the set of priority application numbers pertaining to the invention.

Here the German utility model application number is appearing as a priority application number with the invention, but not with the publication:

Application Number (Thomson Reuters (Scientific))

Format

Application numbers can also be searched and displayed in Thomson Reuters (Scientific) standard. The standard definitions can be found in the appendix. By and large they follow the following pattern:

Thomson Reuters (Scientific) display format YYYYCC-xxxxnnnnnnnnNd

(mostly fixed 9-character length, zero padded if necessary)

Index format: YYYYCC-xxxxnnnnnnnnNd

Where: YYYY = four digit year
 CC = two-letter WIPO country code
 D = indicates a distinguishing mark
 N = number
 A = letter
 X = number or letter
 x = optional alphanumeric character
 n = optional numeric character

For German applications published from January 2004 the first two digits of the twelve digit number indicates the IP right (e.g. a patent application or utility model) followed by a 4-digit year and a 6-digit serial number. For the Thomson Scientific standard the year has been removed and a zero inserted. For example 2004DE-102004012346 appears as 2004DE-100012346.

PCT transfers to the Indian Patent Office are identified by a three letter code designating one of the regional offices (DEL = Delhi, KOL = Kolkata, MUM = Mumbai, CHE = Chennai), the letters 'NP' signifying 'National Phase' and a 5-digit serial number, for example, 2004IN-CHENP00010.

Also, PCT application numbers include the country code of the patent authority where the application is filed. For applications that are filed directly with the International Bureau of the PCT, the code IB has been used since 1994.

Content

Application numbers have been recorded since early 1984 (update 198409) for equivalents from the following sources: BE, DE, EP, GB, JP, SU, WO and NL (examined).

In addition, application numbers have been recorded for the same period for chemical equivalents from: FR, NL (unexamined) and ZA. Since update 199216 however, all application information is recorded.

Gaps in application data coverage have been filled where possible using original data from the following sources:

- German applications, granted patents, and utility models
- European applications and granted patents
- US applications and granted patents
- PCT applications
- Japanese applications

This additional application data is available in a separate search and display field (APTS; Application Number, Thomson Reuters (Scientific)). APTS also contains the application data which has been recorded in DWPI over time and which is available separately within the Application Number (AP) field.

It should be noted however that AP does not contain the additional application data sourced from the above authorities. The AP field therefore remains a reflection of the application data recorded over time within DWPI.

It should be noted however that AP does not contain the additional application data sourced from the above authorities. The AP field therefore remains a reflection of the application data recorded over time within DWPI.

Search

The APTS field contains numbers from the standard Derwent numbers supplemented in particular for older application numbers with numbers from other sources. For your convenience the /APTS search field has been equipped with software to adjust the format of Derwent and STN standard numbers to the Thomson Reuters (Scientific) format.

Priority Number (Thomson Reuters (Scientific))

Format

Priority Number Thomson Reuters (Scientific) Format

YYYYCC-xxxxnnnnnnnnND

(padded with leading zeros to nine digits where necessary)

Where: YYYY = four digit year
 CC = two-letter WIPO country code
 D = indicates a distinguishing mark
 N = number
 n = optional number
 A = letter
 a = optional letter
 X = number or letter
 x = optional number or letter

The PRTS format mostly contains nine character serial numbers and always includes the year.

Content

When an inventor applies for a patent in several countries, the first application (the one with the earliest date), regardless of the country in which it was filed, is the priority application. And the date of the first application is referred to as the priority date.

All priorities for each patent have been included in DWPI since the middle of 1977 (update 197729). Prior to that date, the number of priorities entered was restricted to ten.

Gaps in priority data coverage have now been filled where possible using original data from the following sources:

- German applications, granted patents, and utility models
- European applications and granted patents
- US applications and granted patents
- PCT applications
- Japanese applications

This additional priority data is available in a separate search and display field (PRTS; Priority Number, Thomson Reuters (Scientific)). PRTS also contains the priority data which has been recorded in DWPI over time and which is available separately within the Priority Number (PRN) field.

Publication Level Field Availability

The field /FA.M contains the following codes indicating the availability of the respective fields at the Patent Publication Level in a given record:

AB	Abstract
ABDE	Author Abstract, German language
ABDT	Documentation Abstract
ABEN	Author Abstract, English language
ABES	Author Abstract, Spanish language
ABEX	Extension Abstract
ABFR	Author Abstract, French language
ABOL	Author Abstract, other language
AG	Agent
AI	Application Information
ALE	Alerting Abstract
ANX	Alternative Accession Number
APTS	Application Number, Thomson Scientific Format
AW	Additional Words
CLMDE	Claim, German language
CLMEN	Claim(s), English language
CLMFR	Claim, French language
CR	Cross Reference/Related Accession Number
DCR	Chemical Resource
DNC	Secondary Accession Number (Chemical Sections A-M)
DNN	Secondary Accession Number (Non-Chemical Sections P, Q, S-X)
DRN	Registry Number
EPC	European Patent Classification

FDT	Filing Details
FTERM	Japanese Patent Classification
GI	Graphic Information
IN	Inventor
INCL	Issued US National Patent Classification
INO	Inventor, original
IPC	International Patent Classification
IPCI	Reform IPC, initial
IPCR	Reform IPC, reclassified
MC	Manual Codes
NCL	Current US National Patent Classifications
PA	Patent Assignee
PACO	Patent Assignee Code
PAO	Patent Assignee, original
PLC	Polymer Coding
PN	Patent Number
PRAI	Priority Information
PRTS	Priority Information, Thomson Scientific Format
TECH	Technology Focus
TI	Title
TIDE	Author title, German language
TIEN	Author title, English language
TIES	Author title, Spanish language
TIFR	Author title, French language
TT	Title Terms

Search

The codes can be searched individually or confined to a single publication.

Holographisches Projektionssystem mit einem Wiedergabeschirm und
mindestens einem holographischen Projektor, der sowohl räumliche
Lichtmodulationsmittel enthält, die eine Wellenfront zum Rekonstruieren
einer Szene mit holographischer Information von Videohologrammen
modulieren, als auch Abbildungsmittel, an denen eine Positionssteuerung
eine Ausbreitungsrichtung der modulierten Wellenfront und eine
Ausgangsposition einstellt, um die modulierte Wellenfront über den
Wiedergabeschirm zu einer gewünschten Augenposition zu führen, und um
die modulierte Wellenfront mit der rekonstruierten Szene der gewünschten
Augenposition nachzuführen, gekennzeichnet durch eine Systemsteuerung,
welche: - in den Lichtmodulationsmitteln (SLM) Modulatorsegmente (MS0...
MSn) separat aktiviert und - mit der Positionssteuerung jeweils eine vom
aktiven Modulatorsegment (MSa) abhängige Ausbreitungsrichtung (D1, D2)
sowie eine entsprechende Ausgangsposition (POS1, POS2) für eine
modulierte Teilwellenfront einstellt, so dass jedes aktive
Modulatorsegment (MSa) über ein zugeordnetes Schirmsegment (Sa) auf dem
Wiedergabeschirm (S) seine modulierte Teilwellenfront mit einem
rekonstruierten Segment der Szene zur gewünschten Augenposition (EP)
richtet, wo alle rekonstruierten Segmente gemeinsam die rekonstruierte
Szene (3DS) vollständig sichtbar machen.

Update codes are assigned to all records to indicate when a new record is added to the database or when information is added to an existing record.

Update Date Author Abstract (/UPAA)

The Author Abstract update code /UPAA is assigned to a record whenever an author abstract is added at the Patent Publication Level.

Update Date Author Title (/UPAT)

The Author Title update code /UPAT is assigned to a record whenever an author title is added at the Patent Publication Level.

Update Date Claims (/UPCL)

The Claims update code /UPCL is assigned to a record whenever a claims field is added at the Patent Publication Level.

Update Date International Patent Classification, Original (/UPIO)

The /UPIO update code is assigned to a record upon the addition of Original IPCs at the Patent Publication Level.

Update Date USPTO Classification, Original (/UPNO)

The /UPNO update code is assigned to a record upon the addition of Original USPTO Classifications at the Patent Publication Level.

Appendix I – Thomson Reuters (Scientific) Standard Abbreviations

Thomson Reuters (Scientific) has abbreviated many commonly occurring words in titles and abstracts (Basic Index) over time. Since 1998 it has been policy not to abbreviate where possible and thus, for comprehensive results, the abbreviation should be searched together with the corresponding full term.

Term	Abbreviation	Term	Abbreviation
addition(s)	addn./addns.	melting point	m.pt.
administration	admin.	minimum	min.
amount(s)	amt./amts.	mixture(s)	mixt./mixts.
apparatus	appts.	molecule(s)	mol./mols.
aqueous	aq.	obtained	obtd.
atmosphere	atmos.	optionally	opt.
boiling point	b.pt.	oxidation	oxidn.
coefficient(s)	coefft./coeffts.	particularly	partic.
composition(s)	compsn./compsns.	parts by weight	pts. wt.
compound(s)	cpd./cpds.	parts per million	ppm.
concentrated	conc.	precipitate(s)	ppte./pptes.
concentration(s)	concn./concns.	precipitated	pptd.
condensation	condensn.	precipitation	pptn.
containing	contg.	preferably	pref.
continuation	cont.	preparation	prepn.
continuation in part	c.i.p.	prepared	prepd.
corresponding	corresp.	primary	prim.

derivative(s)	deriv./derivs.	product(s)	prod./prods.
determination	determn.	production	prodn.
diameter	dia.	purification	purificn.
dilute	dil.	quaternary	quat.
distillation	distn.	reduction	redn.
divided/division	div.	saturated	satd.
divided out of	div. ex	secondary	sec.
equivalent(s)	equiv./equivs.	separated	sepd.
especially	esp.	separating	sepg.
evaporation	evapn.	separation	sepn.
extraction	extrn.	solution(s)	soln./solns.
for example	e.g.	substituent(s)	substit./substis.
gram molecule(s)	mole./moles.	substituted	substd.
group(s)	gp./gps.	temperature(s)	temp./temps.

Additional Codes used by Thomson Reuters (Scientific):

RD Research Disclosure© Kenneth Mason Publications Limited [2006] www.researchdisclosure.com

TP Technology Disclosure 12

Notes:

1. Intergovernmental organisations (regional patent offices) acting for certain Contracting States under the PCT (Patent Cooperation Treaty). In the case of the European Patent Office, it also acts as International Searching Authority and International Preliminary Examining Authority under the PCT.
2. The Benelux Trademark and Designs Offices have replaced the national Offices of Belgium, Luxembourg, and the Netherlands with regard to actions relating to marks and industrial designs.
3. Provisional name
4. In the electronic database of the International Register of Marks, the International Bureau of WIPO uses the following additional codes, not part of the active codes: "DD" to designate Germany without the territory that, prior to 03/10/1990, constituted the Federal Republic of Germany; "DT" to designate Germany without the territory that, prior to 03/10/1990, constituted the German Democratic Republic
5. The code "WO" is used in relation to the international publication under the Patent Cooperation Treaty (PCT) of international applications filed with any PCT receiving office. The code "IB" is used in relation to
 - a. the receipt of international applications under the PCT filed with the International Bureau of WIPO in its capacity as a PCT receiving office.
6. Countries covered in Derwent World Patents Index
7. Countries covered in Derwent World Patents Index that no longer exist
8. Member countries of the EPO (European Patent Office)
9. Extension countries of the EPO (will become members)
10. Member countries of OAPI (African Intellectual Property Organisation).
11. Member countries of ARIPO (African Regional Industrial Property Organisation).
12. TP is used for Technology Disclosure in Derwent World Patents Index

Appendix III – Patent Number Formats and Kind Codes

For patent numbers containing a year element as part of the serial, this is generally a 2-digit format for 19YY (YY) and a 4-digit format for 2000 onwards (20YY). Examples of these have been included in the table below.

Abbreviations used in the table:

NTIS - National Technical Information Service
 OPI - Open for Public Inspection
 PCT - Patent Cooperation Treaty
 CC - Country Code

Country Code	Derwent	Formats STN	Index	Status	Notes
AR	AR-----203725	AR 203725	AR203725	A	Patent [1974 -1976 only]
AT	AT-----8500819	AT 8500819	AT8500819	A	OPI application without examination (old law)

Appendix VI – Japanese Coverage

Initial input comes from the Japanese patent documents on DVD produced by the Japanese Patent Office. DWPI includes the following documents:

- A Unexamined application open for public inspection (Kokai)
- B Examined accepted specification (Kokoku)
- B1 Examined accepted specification not previously published as unexamined
- B2 Examined accepted specification (Kokoku) (from 199404)
- B2 Granted patent (Toroku) (from 199626)
- W World patent application (PCT) transfer originating from abroad
- X World patent application (PCT) transfer originating from Japan
- Y World patent application (PCT) transfer to Utility Model originating from abroad
- Z World patent application (PCT) transfer to Utility Model originating from Japan

Due to the volume of Japanese documents that publish annually, Thomson Scientific initially adopted a special selection criteria for the inclusion of Japanese documents. These were criteria based on the International Patent Classification scheme.

Thomson Scientific included all chemical patents, for both Unexamined and Examined documents in the Chemical Patents Index. All electrical patents for unexamined documents only, were included in the Electrical Patents Index. From 199548, coverage for Unexamined documents (Kokai) was extended to include all technologies. From 200450 (publication date 07.07.2004) the DWPI coverage of JP-B was extended to include all technologies.

DWPI includes the inventor(s) name(s) for Japanese specifications from 1977 onwards.

DWPI Data Elements included Online:

Data Elements	CPI	EPI	EngPI
Bibliographic & Abstract	B(JP-A/B)	B(JP-A/B)	B(JP-A/B)
Bibliographic	B+Eq	B+Eq	-
Manual Code	B	B	-
Fragmentation Code	B	-	-
Markush Code	B	-	-

All entries have Thomson Scientific title plus bibliographic data. Abstracts are included for unexamined applications and for examined CPI basics.

Date of Inclusion: 1963

Effective publication dates:

	Examined	Unexamined
pre-CPI: FARMDOC	09.01.1963	-
AGDOC	01.04.1965	-
PLASDOC	08.04.1966	-
CPI (Sections A-M):	05.01.1970	16.07.1971
EPI/EngPI (Sections S-X):	-	05.01.1982 (IPC 'H')

Since the end of 1995 (update 199548) Derwent World Patents Index has included all Japanese Kokai applications (JP-A documents). Until mid 1995 (update 199528), coverage was restricted to chemical and electrical technologies based on the International Patent Classification (IPC). In the period from update 199528 to update 199548, coverage was phased in online until complete coverage was attained as indicated below:

Subject Area	International Patent Classification	Update
Automotive	B60, F01, F02N, F02P, F16, F17, B65-B68	199528
Computing	G06, G11, B02-B09	199532
Machine Tools	B21-B28, B30-B32, B41-B44, F21-F41	199536
Construction	E01-E21, F02-F15, B61-B64	199540
Instrumentation	G01-G12	199544
Agriculture	A01-A47, A61-A63	199548

The coverage of Japanese patents before update 199528 is shown in the following table by IPC. IPCs other than those shown have a coverage of less than 10%. Those indicated with an asterisk (*) may have abstracts if they have additional IPCs in other groups.

Coverage before update 199528

IPC	Section	IPC Covered	% Covered	Abstracts
A	Human Necessities A01, A21-A24, A41-A47, A61-A63	A01N, A21, A22, A23, A61K	100	Yes
